2 Matrix Approximation

Why Singular Value Decomposition?

- It can be applied to all matrices (not only to square matrices).
- It always exists.

Illustration

$$\mathbf{A} \in \mathbb{R}^{m \times n}, \text{rank}(\mathbf{A}) = r \leq \min(m, n):$$

$$\begin{matrix} n \\ \boxed{\mathbf{A}} \\ m \end{matrix} = \begin{matrix} m \\ \boxed{\mathbf{U}} \\ m \end{matrix} \begin{matrix} n \\ \boxed{\Sigma} \\ m \end{matrix} \begin{matrix} n \\ \boxed{\mathbf{V}^T} \\ n \end{matrix}$$

The diagram shows the SVD of matrix \mathbf{A} . Matrix \mathbf{A} is $m \times n$. It is decomposed into three matrices: \mathbf{U} ($m \times m$), Σ ($m \times n$), and \mathbf{V}^T ($n \times n$). The matrix Σ is shown as a block matrix with a diagonal of singular values $\sigma_1, \sigma_2, \dots, \sigma_r$ and a zero block below. The dimensions m , n , and r are indicated above each matrix.

- $\mathbf{U} \in \mathbb{R}^{m \times m}$ with orthogonal columns vectors \mathbf{u}_i , $i = 1, \dots, m$.
- $\mathbf{V} \in \mathbb{R}^{n \times n}$ with orthogonal columns vectors \mathbf{v}_j , $j = 1, \dots, n$.
- $\Sigma \in \mathbb{R}^{m \times n}$ with $\Sigma_{ii} = \sigma_i \geq 0$ and $\Sigma_{ij} = 0$ for $i \neq j$.
 - σ_i : **singular values**; $\sigma_1 \geq \sigma_2 \geq \dots \geq \sigma_r \geq 0$.
 - \mathbf{u}_i : **left-singular vectors**;
 - \mathbf{v}_j : **right-singular vectors**;

Illustration & Example

$$\begin{aligned}
 \mathbf{A} &= \begin{bmatrix} 1 & -0.8 \\ 0 & 1 \\ 1 & 0 \end{bmatrix} = \mathbf{U}\mathbf{\Sigma}\mathbf{V}^T \\
 &= \begin{bmatrix} -0.79 & 0 & -0.62 \\ 0.38 & -0.78 & -0.49 \\ -0.48 & -0.62 & 0.62 \end{bmatrix} \begin{bmatrix} 1.62 & 0 \\ 0 & 1.0 \\ 0 & 0 \end{bmatrix} \begin{bmatrix} -0.78 & 0.62 \\ -0.62 & -0.78 \end{bmatrix}
 \end{aligned}$$

Exercise

Exercise

Prove that for an $\mathbf{A} \in \mathbb{R}^{m \times n}$, $\mathbf{A}\mathbf{A}^\top$ and $\mathbf{A}^\top\mathbf{A}$ have the same nonzero eigenvalues.

Outline

- 1 Singular Value Decomposition (SVD)
 - Construction of the SVD
 - Example
- 2 Matrix Approximation

SVD & Eigendecomposition

- Recall the eigendecomposition of a symmetric positive definite matrix

$$\mathbf{S} = \mathbf{S}^{\top} = \mathbf{P}\mathbf{D}\mathbf{P}^{\top}.$$

SVD & Eigendecomposition

- Recall the eigendecomposition of a symmetric positive definite matrix

$$\mathbf{S} = \mathbf{S}^{\top} = \mathbf{P}\mathbf{D}\mathbf{P}^{\top}.$$

with the corresponding SVD

$$\mathbf{S} = \mathbf{U}\mathbf{\Sigma}\mathbf{V}^{\top}$$

so $\mathbf{U} = \mathbf{P} = \mathbf{V}$, $\mathbf{D} = \mathbf{\Sigma}$.

The Overall Idea

- Computing the SVD of $\mathbf{A} \in \mathbb{R}^{m \times n} \Leftrightarrow$ Finding two sets of orthonormal bases $U = (\mathbf{u}_1, \dots, \mathbf{u}_m)$ and $V = (\mathbf{v}_1, \dots, \mathbf{v}_n)$ respectively.
- Images of $\mathbf{A}\mathbf{v}_i$'s form a set of orthogonal vectors.

The first step: Constructing the right-singular vectors

- **Recall:** Eigenvectors of a *symmetric* matrix form an **orthonormal basis** (the Spectral theorem).
- Also, we can always construct a **symmetric, positive semidefinite** matrix $\mathbf{A}^\top \mathbf{A} \in \mathbb{R}^{n \times n}$ from any matrix $\mathbf{A} \in \mathbb{R}^{m \times n}$.
- Thus,

$$\mathbf{A}^\top \mathbf{A} = \mathbf{P} \mathbf{D} \mathbf{P}^\top = \mathbf{P} \begin{bmatrix} \lambda_1 & \cdots & 0 \\ \vdots & \ddots & \vdots \\ 0 & \cdots & \lambda_n \end{bmatrix} \mathbf{P}^\top,$$

where \mathbf{P} is orthogonal and composed of orthonormal eigenbasis.

- ★ $\lambda_i \geq 0$ are the eigenvalues of $\mathbf{A}^\top \mathbf{A}$.

The first step (2/2)

- Assume the SVD of \mathbf{A} exists.

$$\mathbf{A}^\top \mathbf{A} = (\mathbf{U} \mathbf{\Sigma} \mathbf{V}^\top)^\top (\mathbf{U} \mathbf{\Sigma} \mathbf{V}^\top) = \mathbf{V} \mathbf{\Sigma}^\top \mathbf{U}^\top \mathbf{U} \mathbf{\Sigma} \mathbf{V}^\top$$

where \mathbf{U} , \mathbf{V} are orthonormal matrices

The first step (2/2)

- Assume the SVD of \mathbf{A} exists.

$$\mathbf{A}^\top \mathbf{A} = (\mathbf{U} \mathbf{\Sigma} \mathbf{V}^\top)^\top (\mathbf{U} \mathbf{\Sigma} \mathbf{V}^\top) = \mathbf{V} \mathbf{\Sigma}^\top \mathbf{U}^\top \mathbf{U} \mathbf{\Sigma} \mathbf{V}^\top$$

where \mathbf{U}, \mathbf{V} are orthonormal matrices ($\because \mathbf{U}^\top \mathbf{U} = \mathbf{I}$).

The first step (2/2)

- Assume the SVD of \mathbf{A} exists.

$$\mathbf{A}^\top \mathbf{A} = (\mathbf{U} \mathbf{\Sigma} \mathbf{V}^\top)^\top (\mathbf{U} \mathbf{\Sigma} \mathbf{V}^\top) = \mathbf{V} \mathbf{\Sigma}^\top \mathbf{U}^\top \mathbf{U} \mathbf{\Sigma} \mathbf{V}^\top$$

where \mathbf{U}, \mathbf{V} are orthonormal matrices ($\because \mathbf{U}^\top \mathbf{U} = \mathbf{I}$). So,

The first step (2/2)

- Assume the SVD of \mathbf{A} exists.

$$\mathbf{A}^\top \mathbf{A} = (\mathbf{U} \mathbf{\Sigma} \mathbf{V}^\top)^\top (\mathbf{U} \mathbf{\Sigma} \mathbf{V}^\top) = \mathbf{V} \mathbf{\Sigma}^\top \mathbf{U}^\top \mathbf{U} \mathbf{\Sigma} \mathbf{V}^\top$$

where \mathbf{U}, \mathbf{V} are orthonormal matrices ($\because \mathbf{U}^\top \mathbf{U} = \mathbf{I}$). So,

$$\mathbf{A}^\top \mathbf{A} = \mathbf{V} \mathbf{\Sigma}^\top \mathbf{\Sigma} \mathbf{V}^\top = \mathbf{V} \begin{bmatrix} \sigma_1^2 & 0 & 0 \\ 0 & \ddots & 0 \\ 0 & 0 & \sigma_n^2 \end{bmatrix} \mathbf{V}^\top$$

- Hence, we identify $\mathbf{V}^\top = \mathbf{P}^\top$ (right-singular vectors) and $\sigma_i^2 = \lambda_i$.

The second step: Constructing the left-singular vectors

- Similarly, we can always construct a **symmetric, positive semidefinite** matrix $\mathbf{A}\mathbf{A}^\top \in \mathbb{R}^{m \times m}$ from any matrix $\mathbf{A} \in \mathbb{R}^{m \times n}$.
- Thus, by assuming the SVD of \mathbf{A} exists, we have

$$\begin{aligned}\mathbf{A}\mathbf{A}^\top &= (\mathbf{U}\mathbf{\Sigma}\mathbf{V}^\top)(\mathbf{U}\mathbf{\Sigma}\mathbf{V}^\top)^\top = \mathbf{U}\mathbf{\Sigma}\mathbf{V}^\top\mathbf{V}\mathbf{\Sigma}^\top\mathbf{U}^\top \\ &= \mathbf{U} \begin{bmatrix} \sigma_1^2 & 0 & 0 \\ 0 & \ddots & 0 \\ 0 & 0 & \sigma_m^2 \end{bmatrix} \mathbf{U}^\top\end{aligned}$$

Note: $\mathbf{A}\mathbf{A}^\top$ and $\mathbf{A}^\top\mathbf{A}$ have the same nonzero eigenvalues.

The second step: Constructing the left-singular vectors

- Similarly, we can always construct a **symmetric, positive semidefinite** matrix $\mathbf{A}\mathbf{A}^\top \in \mathbb{R}^{m \times m}$ from any matrix $\mathbf{A} \in \mathbb{R}^{m \times n}$.
- Thus, by assuming the SVD of \mathbf{A} exists, we have

$$\begin{aligned}\mathbf{A}\mathbf{A}^\top &= (\mathbf{U}\mathbf{\Sigma}\mathbf{V}^\top)(\mathbf{U}\mathbf{\Sigma}\mathbf{V}^\top)^\top = \mathbf{U}\mathbf{\Sigma}\mathbf{V}^\top\mathbf{V}\mathbf{\Sigma}^\top\mathbf{U}^\top \\ &= \mathbf{U} \begin{bmatrix} \sigma_1^2 & 0 & 0 \\ 0 & \ddots & 0 \\ 0 & 0 & \sigma_m^2 \end{bmatrix} \mathbf{U}^\top\end{aligned}$$

Note: $\mathbf{A}\mathbf{A}^\top$ and $\mathbf{A}^\top\mathbf{A}$ have the same nonzero eigenvalues.

⇒ The nonzero entries of $\mathbf{\Sigma}$ in the SVD for both steps must be the same.

The last step: Link up all parts (1/2)

Images of the \mathbf{v}_i under \mathbf{A} must be orthogonal.

$$(\mathbf{A}\mathbf{v}_i)^\top (\mathbf{A}\mathbf{v}_j) = \mathbf{v}_i^\top (\mathbf{A}^\top \mathbf{A}) \mathbf{v}_j = \mathbf{v}_i^\top (\lambda_j \mathbf{v}_j) = \lambda_j \mathbf{v}_i^\top \mathbf{v}_j = 0.$$

(For $m \geq r$) We observe that $\{\mathbf{A}\mathbf{v}_1, \dots, \mathbf{A}\mathbf{v}_r\}$ is a basis of an r -dimensional subspace of \mathbb{R}^m .

The last step: Link up all parts (1/2)

Images of the \mathbf{v}_i under \mathbf{A} must be orthogonal.

$$(\mathbf{A}\mathbf{v}_i)^\top (\mathbf{A}\mathbf{v}_j) = \mathbf{v}_i^\top (\mathbf{A}^\top \mathbf{A}) \mathbf{v}_j = \mathbf{v}_i^\top (\lambda_j \mathbf{v}_j) = \lambda_j \mathbf{v}_i^\top \mathbf{v}_j = 0.$$

(For $m \geq r$) We observe that $\{\mathbf{A}\mathbf{v}_1, \dots, \mathbf{A}\mathbf{v}_r\}$ is a basis of an r -dimensional subspace of \mathbb{R}^m .

- Normalize the images of these right-singular vectors:

$$\mathbf{u}_i := \frac{\mathbf{A}\mathbf{v}_i}{\|\mathbf{A}\mathbf{v}_i\|} = \frac{1}{\sqrt{\lambda_i}} \mathbf{A}\mathbf{v}_i = \frac{1}{\sigma_i} \mathbf{A}\mathbf{v}_i.$$

- That is, $\mathbf{A}\mathbf{v}_i = \sigma_i \mathbf{u}_i$, for $i = 1, \dots, r$.

The last step: Link up all parts (2/2)

- Concatenate the \mathbf{v}_i 's as the columns of \mathbf{V} ;
- Concatenate the \mathbf{u}_i 's as the columns of \mathbf{U} ;

The last step: Link up all parts (2/2)

- Concatenate the \mathbf{v}_i 's as the columns of \mathbf{V} ;
- Concatenate the \mathbf{u}_i 's as the columns of \mathbf{U} ;
- Then,

$$\mathbf{A}\mathbf{V} = \mathbf{U}\mathbf{\Sigma} \in \mathbb{R}^{m \times n}.$$

The last step: Link up all parts (2/2)

- Concatenate the \mathbf{v}_i 's as the columns of \mathbf{V} ;
- Concatenate the \mathbf{u}_i 's as the columns of \mathbf{U} ;
- Then,

$$\mathbf{A}\mathbf{V} = \mathbf{U}\mathbf{\Sigma} \in \mathbb{R}^{m \times n}.$$

Thus,

$$\mathbf{A}\mathbf{V}\mathbf{V}^T = \mathbf{U}\mathbf{\Sigma}\mathbf{V}^T$$

The last step: Link up all parts (2/2)

- Concatenate the \mathbf{v}_i 's as the columns of \mathbf{V} ;
- Concatenate the \mathbf{u}_i 's as the columns of \mathbf{U} ;
- Then,

$$\mathbf{A}\mathbf{V} = \mathbf{U}\mathbf{\Sigma} \in \mathbb{R}^{m \times n}.$$

Thus,

$$\mathbf{A} = \mathbf{A}\mathbf{V}\mathbf{V}^{\top} = \mathbf{U}\mathbf{\Sigma}\mathbf{V}^{\top}$$

Exercise

Why do we have $\mathbf{A} = \mathbf{A}\mathbf{V}\mathbf{V}^{\top}$?

Outline

1 Singular Value Decomposition (SVD)

- Construction of the SVD
- Example

2 Matrix Approximation

Example

Find the singular value decomposition of

$$\mathbf{A} = \begin{bmatrix} 1 & 0 & 1 \\ -2 & 1 & 0 \end{bmatrix}$$

Example

Find the singular value decomposition of

$$\mathbf{A} = \begin{bmatrix} 1 & 0 & 1 \\ -2 & 1 & 0 \end{bmatrix}$$

Note:

$$\mathbf{A}^T \mathbf{A} = \begin{bmatrix} 1 & -2 \\ 0 & 1 \\ 1 & 0 \end{bmatrix} \begin{bmatrix} 1 & 0 & 1 \\ -2 & 1 & 0 \end{bmatrix} = \begin{bmatrix} 5 & -2 & 1 \\ -2 & 1 & 0 \\ 1 & 0 & 1 \end{bmatrix}.$$

SVD Example (step 1/2)

Goal: Find $\mathbf{A} = \mathbf{U}\mathbf{\Sigma}\mathbf{V}^\top$.

Perform eigendecomposition of $\mathbf{A}^\top \mathbf{A} = \mathbf{PDP}^\top$:

SVD Example (step 1/2)

Goal: Find $\mathbf{A} = \mathbf{U}\mathbf{\Sigma}\mathbf{V}^\top$.

Perform eigendecomposition of $\mathbf{A}^\top \mathbf{A} = \mathbf{PDP}^\top$:

$$\mathbf{A}^\top \mathbf{A} = \begin{bmatrix} \frac{5}{\sqrt{30}} & 0 & \frac{-1}{\sqrt{6}} \\ \frac{-2}{\sqrt{30}} & \frac{1}{\sqrt{5}} & \frac{-2}{\sqrt{6}} \\ \frac{1}{\sqrt{30}} & \frac{2}{\sqrt{5}} & \frac{1}{\sqrt{6}} \end{bmatrix} \begin{bmatrix} 6 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} \frac{5}{\sqrt{30}} & \frac{-2}{\sqrt{30}} & \frac{1}{\sqrt{30}} \\ 0 & \frac{1}{\sqrt{5}} & \frac{2}{\sqrt{5}} \\ \frac{-1}{\sqrt{6}} & \frac{-2}{\sqrt{6}} & \frac{1}{\sqrt{6}} \end{bmatrix}$$

SVD Example (step 1/2)

Goal: Find $\mathbf{A} = \mathbf{U}\mathbf{\Sigma}\mathbf{V}^\top$.

Perform eigendecomposition of $\mathbf{A}^\top \mathbf{A} = \mathbf{PDP}^\top$:

$$\mathbf{A}^\top \mathbf{A} = \begin{bmatrix} \frac{5}{\sqrt{30}} & 0 & \frac{-1}{\sqrt{6}} \\ \frac{-2}{\sqrt{30}} & \frac{1}{\sqrt{5}} & \frac{-2}{\sqrt{6}} \\ \frac{1}{\sqrt{30}} & \frac{2}{\sqrt{5}} & \frac{1}{\sqrt{6}} \end{bmatrix} \begin{bmatrix} 6 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} \frac{5}{\sqrt{30}} & \frac{-2}{\sqrt{30}} & \frac{1}{\sqrt{30}} \\ 0 & \frac{1}{\sqrt{5}} & \frac{2}{\sqrt{5}} \\ \frac{-1}{\sqrt{6}} & \frac{-2}{\sqrt{6}} & \frac{1}{\sqrt{6}} \end{bmatrix}$$

So,

$$\mathbf{V} = \mathbf{P} = \begin{bmatrix} \frac{5}{\sqrt{30}} & 0 & \frac{-1}{\sqrt{6}} \\ \frac{-2}{\sqrt{30}} & \frac{1}{\sqrt{5}} & \frac{-2}{\sqrt{6}} \\ \frac{1}{\sqrt{30}} & \frac{2}{\sqrt{5}} & \frac{1}{\sqrt{6}} \end{bmatrix}, \quad \mathbf{\Sigma} = \begin{bmatrix} \sqrt{6} & 0 & 0 \\ 0 & 1 & 0 \end{bmatrix}$$

where $\sigma^2 = 6$, $\sigma_2^2 = 1 \Rightarrow \sigma_1 = \sqrt{6}$, $\sigma_2 = 1$.

SVD Example (step 2/2)

Left-singular vectors:

SVD Example (step 2/2)

Left-singular vectors:

$$\mathbf{u}_1 = \frac{1}{\sigma_1} \mathbf{A} \mathbf{v}_1 = \frac{1}{\sqrt{6}} \begin{bmatrix} 1 & 0 & 1 \\ -2 & 1 & 0 \end{bmatrix} \begin{bmatrix} 5/\sqrt{30} \\ -2/\sqrt{30} \\ 1/\sqrt{30} \end{bmatrix} = \begin{bmatrix} 1/\sqrt{5} \\ -2/\sqrt{5} \end{bmatrix},$$

$$\mathbf{u}_2 = \frac{1}{\sigma_2} \mathbf{A} \mathbf{v}_2 = \frac{1}{1} \begin{bmatrix} 1 & 0 & 1 \\ -2 & 1 & 0 \end{bmatrix} \begin{bmatrix} 0 \\ 1/\sqrt{5} \\ 2/\sqrt{5} \end{bmatrix} = \begin{bmatrix} 2/\sqrt{5} \\ 1/\sqrt{5} \end{bmatrix}.$$

Then, we derive $\mathbf{U} = [\mathbf{u}_1, \mathbf{u}_2] = \frac{1}{\sqrt{5}} \begin{bmatrix} 1 & 2 \\ -2 & 1 \end{bmatrix}$.

Outline

- 1 Singular Value Decomposition (SVD)
 - Construction of the SVD
 - Example
- 2 Matrix Approximation

Motivation

- Represent a matrix \mathbf{A} as a **sum of simpler low-rank matrices** \mathbf{A}_i .
- Cheaper than computing the full SVD.
- Rank-1 matrix $\mathbf{A}_i \in \mathbb{R}^{m \times n}$:

$$\mathbf{A}_i = \mathbf{u}_i \mathbf{v}_i^\top. \quad (\text{outer product})$$

Motivation

- Represent a matrix \mathbf{A} as a **sum of simpler low-rank matrices** \mathbf{A}_i .
- Cheaper than computing the full SVD.
- Rank-1 matrix $\mathbf{A}_i \in \mathbb{R}^{m \times n}$:

$$\mathbf{A}_i = \mathbf{u}_i \mathbf{v}_i^\top. \quad (\text{outer product})$$

- In fact, we can derive

$$\mathbf{A} = \sum_{i=1}^r \sigma_i \mathbf{u}_i \mathbf{v}_i^\top = \sum_{i=1}^r \sigma_i \mathbf{A}_i.$$

- Outer-product matrices \mathbf{A}_i weighted by the i th singular value σ_i .

- σ_i is multiplied with \mathbf{u}_i and \mathbf{v}_i^\top .

Rank- k Approximation

Up to an intermediate value $k < r$ (assume that σ_i 's are sorted in decreasing order),

$$\hat{\mathbf{A}}(k) := \sum_{i=1}^k \sigma_i \mathbf{u}_i \mathbf{v}_i^{\top} = \sum_{i=1}^k \sigma_i \mathbf{A}_i$$

Illustrating example

(a) Original image A .

(b) Rank-1 approximation $\hat{A}(1)$.

(c) Rank-2 approximation $\hat{A}(2)$.

(d) Rank-3 approximation $\hat{A}(3)$.

(e) Rank-4 approximation $\hat{A}(4)$.

(f) Rank-5 approximation $\hat{A}(5)$.

Measure the difference b/w \mathbf{A} and $\hat{\mathbf{A}}$

Spectral Norm

For $\mathbf{x} \in \mathbb{R}^n \setminus \{\mathbf{0}\}$, the spectral norm of $\mathbf{A} \in \mathbb{R}^{m \times n}$ is

$$\|\mathbf{A}\|_2 = \max_{\mathbf{x}} \frac{\|\mathbf{Ax}\|_2}{\|\mathbf{x}\|_2}$$

Measure the difference b/w \mathbf{A} and $\hat{\mathbf{A}}$

Spectral Norm

For $\mathbf{x} \in \mathbb{R}^n \setminus \{\mathbf{0}\}$, the spectral norm of $\mathbf{A} \in \mathbb{R}^{m \times n}$ is

$$\|\mathbf{A}\|_2 = \max_{\mathbf{x}} \frac{\|\mathbf{Ax}\|_2}{\|\mathbf{x}\|_2}$$

- Think about why we need to divide the norm $\|\mathbf{x}\|_2$.

Theorem & Exercise

Theorem (4.24)

The spectral norm of \mathbf{A} is its largest singular value σ_1 .

Eckart-Young Theorem

Theorem [Eckart & Young 1936]

Consider $\mathbf{A} \in \mathbb{R}^{m \times n}$ of rank r and let $\mathbf{B} \in \mathbb{R}^{m \times n}$ be a matrix of rank k .

Then for any $k \leq r$ with $\hat{\mathbf{A}}(k) = \sum_{i=1}^k \sigma_i \mathbf{u}_i \mathbf{v}_i^\top$, it holds that

$$\hat{\mathbf{A}}(k) = \arg \min_{\text{rank}(\mathbf{B})=k} \|\mathbf{A} - \mathbf{B}\|_2,$$

$$\|\mathbf{A} - \hat{\mathbf{A}}(k)\|_2 = \sigma_{k+1}.$$

Physical meaning:

- We can view the rank- k approximation as a **projection** of the matrix \mathbf{A} onto a lower-dimensional space of rank-at-most- k matrices.
- The approximation error: the next singular value (i.e., σ_{k+1})!

Sketch of the Proof (1/2)

Note that

$$\mathbf{A} - \hat{\mathbf{A}}(k) = \sum_{i=k+1}^r \sigma_i \mathbf{u}_i \mathbf{v}_i^{\top}.$$

By Theorem 4.24, we have $\|\mathbf{A} - \hat{\mathbf{A}}(k)\|_2 = \sigma_{k+1}$ (spectral norm).

Sketch of the Proof (1/2)

Note that

$$\mathbf{A} - \hat{\mathbf{A}}(k) = \sum_{i=k+1}^r \sigma_i \mathbf{u}_i \mathbf{v}_i^{\top}.$$

By Theorem 4.24, we have $\|\mathbf{A} - \hat{\mathbf{A}}(k)\|_2 = \sigma_{k+1}$ (spectral norm).

But why $\hat{\mathbf{A}}$ is the *best* approximation in some sense?

Sketch of the Proof (1/2)

Note that

$$\mathbf{A} - \hat{\mathbf{A}}(k) = \sum_{i=k+1}^r \sigma_i \mathbf{u}_i \mathbf{v}_i^{\top}.$$

By Theorem 4.24, we have $\|\mathbf{A} - \hat{\mathbf{A}}(k)\|_2 = \sigma_{k+1}$ (spectral norm).

But why $\hat{\mathbf{A}}$ is the *best* approximation in some sense?

Assume that $r > k$ and there is another \mathbf{B} with $\text{rank}(\mathbf{B}) \leq k$, such that

$$\|\mathbf{A} - \mathbf{B}\|_2 < \|\mathbf{A} - \hat{\mathbf{A}}(k)\|_2.$$

Sketch of the Proof (2/2)

Note that $\dim(\text{null}(\mathbf{B})) \geq n - k$.

Sketch of the Proof (2/2)

Note that $\dim(\text{null}(\mathbf{B})) \geq n - k$.

There exists an $\geq (n - k)$ -dimensional null space $Z \subseteq \mathbb{R}^n$ such that

$$\mathbf{x} \in Z, \mathbf{B}\mathbf{x} = \mathbf{0}.$$

Sketch of the Proof (2/2)

Note that $\dim(\text{null}(\mathbf{B})) \geq n - k$.

There exists an $\geq (n - k)$ -dimensional null space $Z \subseteq \mathbb{R}^n$ such that

$$\mathbf{x} \in Z, \mathbf{B}\mathbf{x} = \mathbf{0}.$$

$$\Rightarrow \|\mathbf{A}\mathbf{x}\|_2 = \|(\mathbf{A} - \mathbf{B})\mathbf{x}\|_2$$

Sketch of the Proof (2/2)

Note that $\dim(\text{null}(\mathbf{B})) \geq n - k$.

There exists an $\geq (n - k)$ -dimensional null space $Z \subseteq \mathbb{R}^n$ such that

$$\mathbf{x} \in Z, \mathbf{B}\mathbf{x} = \mathbf{0}.$$

$$\Rightarrow \|\mathbf{A}\mathbf{x}\|_2 = \|(\mathbf{A} - \mathbf{B})\mathbf{x}\|_2 \leq \|\mathbf{A} - \mathbf{B}\|_2 \|\mathbf{x}\|_2$$

Sketch of the Proof (2/2)

Note that $\dim(\text{null}(\mathbf{B})) \geq n - k$.

There exists an $\geq (n - k)$ -dimensional null space $Z \subseteq \mathbb{R}^n$ such that

$$\mathbf{x} \in Z, \mathbf{B}\mathbf{x} = \mathbf{0}.$$

$$\Rightarrow \|\mathbf{A}\mathbf{x}\|_2 = \|(\mathbf{A} - \mathbf{B})\mathbf{x}\|_2 \leq \|\mathbf{A} - \mathbf{B}\|_2 \|\mathbf{x}\|_2 < \sigma_{k+1} \|\mathbf{x}\|_2. \quad \cdots (\dagger)$$

Sketch of the Proof (2/2)

Note that $\dim(\text{null}(\mathbf{B})) \geq n - k$.

There exists an $\geq (n - k)$ -dimensional null space $Z \subseteq \mathbb{R}^n$ such that

$$\mathbf{x} \in Z, \mathbf{B}\mathbf{x} = \mathbf{0}.$$

$$\Rightarrow \|\mathbf{A}\mathbf{x}\|_2 = \|(\mathbf{A} - \mathbf{B})\mathbf{x}\|_2 \leq \|\mathbf{A} - \mathbf{B}\|_2 \|\mathbf{x}\|_2 < \sigma_{k+1} \|\mathbf{x}\|_2. \quad \cdots (\dagger)$$

However, there exists a $(k + 1)$ -dimensional subspace Y spanned by $\mathbf{v}_1, \dots, \mathbf{v}_{k+1}$.

Sketch of the Proof (2/2)

Note that $\dim(\text{null}(\mathbf{B})) \geq n - k$.

There exists an $\geq (n - k)$ -dimensional null space $Z \subseteq \mathbb{R}^n$ such that

$$\mathbf{x} \in Z, \mathbf{B}\mathbf{x} = \mathbf{0}.$$

$$\Rightarrow \|\mathbf{A}\mathbf{x}\|_2 = \|(\mathbf{A} - \mathbf{B})\mathbf{x}\|_2 \leq \|\mathbf{A} - \mathbf{B}\|_2 \|\mathbf{x}\|_2 < \sigma_{k+1} \|\mathbf{x}\|_2. \quad \cdots (\dagger)$$

However, there exists a $(k + 1)$ -dimensional subspace Y spanned by $\mathbf{v}_1, \dots, \mathbf{v}_{k+1}$.

Note that for $\mathbf{x} \in Y$, $\|\mathbf{A}\mathbf{x}\|_2 \geq \sigma_{k+1} \|\mathbf{x}\|_2. \quad \cdots (\ddagger) \quad (\text{Exercise!})$

Sketch of the Proof (2/2)

Note that $\dim(\text{null}(\mathbf{B})) \geq n - k$.

There exists an $\geq (n - k)$ -dimensional null space $Z \subseteq \mathbb{R}^n$ such that

$$\mathbf{x} \in Z, \mathbf{B}\mathbf{x} = \mathbf{0}.$$

$$\Rightarrow \|\mathbf{A}\mathbf{x}\|_2 = \|(\mathbf{A} - \mathbf{B})\mathbf{x}\|_2 \leq \|\mathbf{A} - \mathbf{B}\|_2 \|\mathbf{x}\|_2 < \sigma_{k+1} \|\mathbf{x}\|_2. \quad \cdots (\dagger)$$

However, there exists a $(k + 1)$ -dimensional subspace Y spanned by $\mathbf{v}_1, \dots, \mathbf{v}_{k+1}$.

Note that for $\mathbf{x} \in Y$, $\|\mathbf{A}\mathbf{x}\|_2 \geq \sigma_{k+1} \|\mathbf{x}\|_2. \quad \cdots (\ddagger) \quad (\text{Exercise!})$

But by the Dimension Theorem (rank-nullity theorem), there must be $\mathbf{x} \in Y \cap Z. \quad (\Rightarrow \times \Rightarrow)$

Sketch of the Proof of (\dagger)

- For any $\mathbf{x} \in Y = \text{span}\{\mathbf{v}_1, \dots, \mathbf{v}_{k+1}\}$, write $\mathbf{x} = \sum_{i=1}^{k+1} \alpha_i \mathbf{v}_i$.
- \mathbf{v}_i 's and \mathbf{u}_i 's are orthonormal \Rightarrow

$$\|\mathbf{x}\|_2^2 = \sum_{i=1}^{k+1} \alpha_i^2, \quad \mathbf{Ax} = \sum_{i=1}^{k+1} \alpha_i \mathbf{Av}_i = \sum_{i=1}^{k+1} \alpha_i \sigma_i \mathbf{u}_i.$$

- Hence,

$$\|\mathbf{Ax}\|_2^2 = \left\| \sum_{i=1}^{k+1} \alpha_i \sigma_i \mathbf{u}_i \right\|_2^2 = \sum_{i=1}^{k+1} \sigma_i^2 \alpha_i^2 \geq \sigma_{k+1}^2 \sum_{i=1}^{k+1} \alpha_i^2 = \sigma_{k+1}^2 \|\mathbf{x}\|_2^2.$$
