Introduction

- The Gaussian distribution (a.k.s. normal distribution) is the most well-studied probability distribution for continuous-valued random variables.
- Widely used in statistics and machine learning.

Gaussian Distributions Overlaid with Samples

Univariate & Multivariate Gaussian

The probability density functions.

Univariate

$$p(x \mid \mu, \sigma^2) = \frac{1}{\sqrt{2\pi\sigma^2}} \exp\left(-\frac{(x - \mu)^2}{2\sigma^2}\right).$$

$$\Sigma = \mathbb{V}_X[\mathbf{x}] = \text{Cov}_X[\mathbf{x}, \mathbf{x}].$$

Multivariate

$$p(\mathbf{x} \mid \boldsymbol{\mu}, \Sigma) = (2\pi)^{-\frac{D}{2}} \det(\Sigma)^{-\frac{1}{2}} \exp\left(-\frac{1}{2}(\mathbf{x} - \boldsymbol{\mu})^\top \Sigma^{-1}(\mathbf{x} - \boldsymbol{\mu})\right),$$

for $\mathbf{x} \in \mathbb{R}^D$.

We write $p(\mathbf{x}) = \mathcal{N}(\mathbf{x} \mid \boldsymbol{\mu}, \Sigma)$ or $X \sim \mathcal{N}(\boldsymbol{\mu}, \Sigma)$.

Gaussian distribution of two random variables x_1, x_2 .

Marginals and Conditionals of Gaussians

- Let X, Y be two multivariate random variables.
- Concatenate their states to be $[\mathbf{x}^\top, \mathbf{y}^\top]$.

$$p(\mathbf{x}, \mathbf{y}) = \mathcal{N} \left(\begin{bmatrix} \boldsymbol{\mu}_x \\ \boldsymbol{\mu}_y \end{bmatrix}, \begin{bmatrix} \boldsymbol{\Sigma}_{xx} & \boldsymbol{\Sigma}_{xy} \\ \boldsymbol{\Sigma}_{yx} & \boldsymbol{\Sigma}_{yy} \end{bmatrix} \right),$$

where $\boldsymbol{\Sigma}_{xx} = \text{Cov}[\mathbf{x}, \mathbf{x}]$, $\boldsymbol{\Sigma}_{yy} = \text{Cov}[\mathbf{y}, \mathbf{y}]$, $\boldsymbol{\Sigma}_{xy} = \text{Cov}[\mathbf{x}, \mathbf{y}]$.

- By [Bishop 2006], the conditional distribution $p(\mathbf{x} | \mathbf{y})$ is also Gaussian.

$$\begin{aligned} p(\mathbf{x} | \mathbf{y}) &= \mathcal{N}(\boldsymbol{\mu}_{x|y}, \boldsymbol{\Sigma}_{x|y}) \\ \boldsymbol{\mu}_{x|y} &= \boldsymbol{\mu}_x + \boldsymbol{\Sigma}_{xy} \boldsymbol{\Sigma}_{yy}^{-1} (\mathbf{y} - \boldsymbol{\mu}_y) \\ \boldsymbol{\Sigma}_{x|y} &= \boldsymbol{\Sigma}_{xx} - \boldsymbol{\Sigma}_{xy} \boldsymbol{\Sigma}_{yy}^{-1} \boldsymbol{\Sigma}_{yx}. \end{aligned}$$

$$p(\mathbf{x}) = \int p(\mathbf{x}, \mathbf{y}) d\mathbf{y} = \mathcal{N}(\mathbf{x} | \boldsymbol{\mu}_x, \boldsymbol{\Sigma}_{xx}).$$

Example

Consider $p(x_1, x_2) = \mathcal{N}\left(\begin{bmatrix} 0 \\ 2 \end{bmatrix}, \begin{bmatrix} 0.3 & -1 \\ -1 & 5 \end{bmatrix}\right)$.

Example

Consider $p(x_1, x_2) = \mathcal{N}\left(\begin{bmatrix} 0 \\ 2 \end{bmatrix}, \begin{bmatrix} 0.3 & -1 \\ -1 & 5 \end{bmatrix}\right)$.

Conditioned on $x_2 = -1$, $\mu_{x_1|x_2=-1} = 0 + (-1) \cdot 0.2 \cdot (-1 - 2) = 0.6$

Example

Consider $p(x_1, x_2) = \mathcal{N}\left(\begin{bmatrix} 0 \\ 2 \end{bmatrix}, \begin{bmatrix} 0.3 & -1 \\ -1 & 5 \end{bmatrix}\right)$.

Conditioned on $x_2 = -1$, $\mu_{x_1|x_2=-1} = 0 + (-1) \cdot 0.2 \cdot (-1 - 2) = 0.6$
 and $\sigma_{x_1|x_2=-1}^2 =$

Example

Consider $p(x_1, x_2) = \mathcal{N}\left(\begin{bmatrix} 0 \\ 2 \end{bmatrix}, \begin{bmatrix} 0.3 & -1 \\ -1 & 5 \end{bmatrix}\right)$.

Conditioned on $x_2 = -1$, $\mu_{x_1|x_2=-1} = 0 + (-1) \cdot 0.2 \cdot (-1 - 2) = 0.6$
 and $\sigma_{x_1|x_2=-1}^2 = 0.3 - (-1) \cdot 0.2 \cdot (-1) = 0.1$.

Thus, $p(x_1 | x_2 = -1) =$

Example

Consider $p(x_1, x_2) = \mathcal{N}\left(\begin{bmatrix} 0 \\ 2 \end{bmatrix}, \begin{bmatrix} 0.3 & -1 \\ -1 & 5 \end{bmatrix}\right)$.

Conditioned on $x_2 = -1$, $\mu_{x_1|x_2=-1} = 0 + (-1) \cdot 0.2 \cdot (-1 - 2) = 0.6$
 and $\sigma^2_{x_1|x_2=-1} = 0.3 - (-1) \cdot 0.2 \cdot (-1) = 0.1$.

Thus, $p(x_1 | x_2 = -1) = \mathcal{N}(0.6, 0.1)$,

Example

Consider $p(x_1, x_2) = \mathcal{N}\left(\begin{bmatrix} 0 \\ 2 \end{bmatrix}, \begin{bmatrix} 0.3 & -1 \\ -1 & 5 \end{bmatrix}\right)$.

Conditioned on $x_2 = -1$, $\mu_{x_1|x_2=-1} = 0 + (-1) \cdot 0.2 \cdot (-1 - 2) = 0.6$
 and $\sigma_{x_1|x_2=-1}^2 = 0.3 - (-1) \cdot 0.2 \cdot (-1) = 0.1$.

Thus, $p(x_1 | x_2 = -1) = \mathcal{N}(0.6, 0.1)$, $p(x_1) =$

Example

Consider $p(x_1, x_2) = \mathcal{N}\left(\begin{bmatrix} 0 \\ 2 \end{bmatrix}, \begin{bmatrix} 0.3 & -1 \\ -1 & 5 \end{bmatrix}\right)$.

Conditioned on $x_2 = -1$, $\mu_{x_1|x_2=-1} = 0 + (-1) \cdot 0.2 \cdot (-1 - 2) = 0.6$
 and $\sigma_{x_1|x_2=-1}^2 = 0.3 - (-1) \cdot 0.2 \cdot (-1) = 0.1$.

Thus, $p(x_1 | x_2 = -1) = \mathcal{N}(0.6, 0.1)$, $p(x_1) = \mathcal{N}(0, 0.3)$.

Sum of Gaussians

Say X, Y are two independent Gaussian random variables with

$$X \sim \mathcal{N}(\boldsymbol{\mu}_x, \boldsymbol{\Sigma}_x) \text{ and } Y \sim \mathcal{N}(\boldsymbol{\mu}_y, \boldsymbol{\Sigma}_y).$$

Sum of Gaussians

Say X, Y are two independent Gaussian random variables with

$$X \sim \mathcal{N}(\boldsymbol{\mu}_x, \boldsymbol{\Sigma}_x) \text{ and } Y \sim \mathcal{N}(\boldsymbol{\mu}_y, \boldsymbol{\Sigma}_y).$$

- independency: $p(\mathbf{x}, \mathbf{y}) = p(\mathbf{x})p(\mathbf{y})$.

Sum of Gaussians

Say X, Y are two independent Gaussian random variables with

$$X \sim \mathcal{N}(\boldsymbol{\mu}_x, \boldsymbol{\Sigma}_x) \text{ and } Y \sim \mathcal{N}(\boldsymbol{\mu}_y, \boldsymbol{\Sigma}_y).$$

- independency: $p(\mathbf{x}, \mathbf{y}) = p(\mathbf{x})p(\mathbf{y})$.

Then $X + Y$ is also a Gaussian distribution with

$$X + Y \sim \mathcal{N}(\boldsymbol{\mu}_x + \boldsymbol{\mu}_y, \boldsymbol{\Sigma}_x + \boldsymbol{\Sigma}_y)$$

Sum of Gaussians

Say X, Y are two independent Gaussian random variables with

$$X \sim \mathcal{N}(\boldsymbol{\mu}_x, \boldsymbol{\Sigma}_x) \text{ and } Y \sim \mathcal{N}(\boldsymbol{\mu}_y, \boldsymbol{\Sigma}_y).$$

- independency: $p(\mathbf{x}, \mathbf{y}) = p(\mathbf{x})p(\mathbf{y})$.

Then $X + Y$ is also a Gaussian distribution with

$$X + Y \sim \mathcal{N}(\boldsymbol{\mu}_x + \boldsymbol{\mu}_y, \boldsymbol{\Sigma}_x + \boldsymbol{\Sigma}_y)$$

Please recall $\mathbb{E}[\mathbf{x} + \mathbf{y}]$ and $\mathbb{V}[\mathbf{x} + \mathbf{y}]$.

Example

Linear Combination of Two Independent Gaussians

$$p(ax + by) =$$

Example

Linear Combination of Two Independent Gaussians

$$p(ax + by) = \mathcal{N}(a\mu_x + b\mu_y,$$

Example

Linear Combination of Two Independent Gaussians

$$p(a\mathbf{x} + b\mathbf{y}) = \mathcal{N}(a\boldsymbol{\mu}_x + b\boldsymbol{\mu}_y, a^2\boldsymbol{\Sigma}_x + b^2\boldsymbol{\Sigma}_y).$$

Example

Linear Combination of Two Independent Gaussians

$$p(ax + by) = \mathcal{N}(a\mu_x + b\mu_y, a^2\Sigma_x + b^2\Sigma_y).$$

Theorem [Mixture of Two Univariate Gaussian Densities]

Consider a mixture of two univariate Gaussian densities

$$p(x) = \alpha p_1(x) + (1 - \alpha)p_2(x)$$

for the **mixture weight** $0 < \alpha < 1$ and $(\mu_1, \sigma_1^2) \neq (\mu_2, \sigma_2^2)$. Then,

$$\mathbb{E}[x] = \alpha\mu_1 + (1 - \alpha)\mu_2$$

$$\begin{aligned}\mathbb{V}[x] &= [\alpha\sigma_1^2 + (1 - \alpha)\sigma_2^2] \\ &\quad + ([\alpha\mu_1^2 + (1 - \alpha)\mu_2^2] - [\alpha\mu_1 + (1 - \alpha)\mu_2]^2).\end{aligned}$$

Proof of the Theorem

Sketch:

$$\begin{aligned} \textcircled{1} \quad \mathbb{E}[x] &= \int_{-\infty}^{\infty} xp(x)dx = \int_{-\infty}^{\infty} (\alpha xp_1(x) + (1 - \alpha)xp_2(x))dx \\ &= \alpha\mu_1 + (1 - \alpha)\mu_2. \end{aligned}$$

$$\textcircled{2} \quad \mathbb{E}[x^2] =$$

Proof of the Theorem

Sketch:

$$\begin{aligned} \textcircled{1} \quad \mathbb{E}[x] &= \int_{-\infty}^{\infty} xp(x)dx = \int_{-\infty}^{\infty} (\alpha xp_1(x) + (1 - \alpha)xp_2(x))dx \\ &= \alpha\mu_1 + (1 - \alpha)\mu_2. \end{aligned}$$

$$\begin{aligned} \textcircled{2} \quad \mathbb{E}[x^2] &= \int_{-\infty}^{\infty} x^2p(x)dx = \int_{-\infty}^{\infty} (\alpha x^2p_1(x) + (1 - \alpha)x^2p_2(x))dx \\ &= \alpha(\mu_1^2 + \sigma_1^2) + (1 - \alpha)(\mu_2^2 + \sigma_2^2). \end{aligned}$$

Proof of the Theorem

Sketch:

$$\begin{aligned} \textcircled{1} \quad \mathbb{E}[x] &= \int_{-\infty}^{\infty} xp(x)dx = \int_{-\infty}^{\infty} (\alpha xp_1(x) + (1 - \alpha)xp_2(x))dx \\ &= \alpha\mu_1 + (1 - \alpha)\mu_2. \end{aligned}$$

$$\begin{aligned} \textcircled{2} \quad \mathbb{E}[x^2] &= \int_{-\infty}^{\infty} x^2p(x)dx = \int_{-\infty}^{\infty} (\alpha x^2p_1(x) + (1 - \alpha)x^2p_2(x))dx \\ &= \alpha(\mu_1^2 + \sigma_1^2) + (1 - \alpha)(\mu_2^2 + \sigma_2^2). \end{aligned}$$

• **Recall:** $\mathbb{V}_X[x] = \mathbb{E}_X[x^2] - (\mathbb{E}_X[x])^2.$

Proof of the Theorem

Sketch:

$$\textcircled{1} \quad \mathbb{E}[x] = \int_{-\infty}^{\infty} xp(x)dx = \int_{-\infty}^{\infty} (\alpha xp_1(x) + (1 - \alpha)xp_2(x))dx \\ = \alpha\mu_1 + (1 - \alpha)\mu_2.$$

$$\textcircled{2} \quad \mathbb{E}[x^2] = \int_{-\infty}^{\infty} x^2p(x)dx = \int_{-\infty}^{\infty} (\alpha x^2p_1(x) + (1 - \alpha)x^2p_2(x))dx \\ = \alpha(\mu_1^2 + \sigma_1^2) + (1 - \alpha)(\mu_2^2 + \sigma_2^2).$$

- **Recall:** $\mathbb{V}_X[x] = \mathbb{E}_X[x^2] - (\mathbb{E}_X[x])^2.$

Using $\textcircled{1}$ & $\textcircled{2}$ we can prove the theorem.

Linear Transformation by a Matrix (1/2)

$X \sim \mathcal{N}(\mu, \Sigma)$ and $\mathbf{y} = \mathbf{A}\mathbf{x}$

- The expectation: $\mathbb{E}[\mathbf{y}] = \mathbb{E}[\mathbf{A}\mathbf{x}] =$

Linear Transformation by a Matrix (1/2)

$X \sim \mathcal{N}(\mu, \Sigma)$ and $\mathbf{y} = \mathbf{A}\mathbf{x}$

- The expectation: $\mathbb{E}[\mathbf{y}] = \mathbb{E}[\mathbf{A}\mathbf{x}] = \mathbf{A}\mathbb{E}[\mathbf{x}] = \mathbf{A}\mu$.

Linear Transformation by a Matrix (1/2)

$\mathbf{X} \sim \mathcal{N}(\boldsymbol{\mu}, \boldsymbol{\Sigma})$ and $\mathbf{y} = \mathbf{A}\mathbf{x}$

- The expectation: $\mathbb{E}[\mathbf{y}] = \mathbb{E}[\mathbf{A}\mathbf{x}] = \mathbf{A}\mathbb{E}[\mathbf{x}] = \mathbf{A}\boldsymbol{\mu}$.
- The variance: $\mathbb{V}[\mathbf{y}] = \mathbb{V}[\mathbf{A}\mathbf{x}] =$

Linear Transformation by a Matrix (1/2)

$\mathbf{X} \sim \mathcal{N}(\boldsymbol{\mu}, \boldsymbol{\Sigma})$ and $\mathbf{y} = \mathbf{A}\mathbf{x}$

- The expectation: $\mathbb{E}[\mathbf{y}] = \mathbb{E}[\mathbf{A}\mathbf{x}] = \mathbf{A}\mathbb{E}[\mathbf{x}] = \mathbf{A}\boldsymbol{\mu}$.
- The variance: $\mathbb{V}[\mathbf{y}] = \mathbb{V}[\mathbf{A}\mathbf{x}] = \mathbf{A}\mathbb{V}[\mathbf{x}]\mathbf{A}^\top = \mathbf{A}\boldsymbol{\Sigma}\mathbf{A}^\top$.

Linear Transformation by a Matrix (1/2)

$X \sim \mathcal{N}(\mu, \Sigma)$ and $\mathbf{y} = \mathbf{A}\mathbf{x}$

- The expectation: $\mathbb{E}[\mathbf{y}] = \mathbb{E}[\mathbf{A}\mathbf{x}] = \mathbf{A}\mathbb{E}[\mathbf{x}] = \mathbf{A}\mu$.
- The variance: $\mathbb{V}[\mathbf{y}] = \mathbb{V}[\mathbf{A}\mathbf{x}] = \mathbf{A}\mathbb{V}[\mathbf{x}]\mathbf{A}^\top = \mathbf{A}\Sigma\mathbf{A}^\top$.
- Thus, we have

Linear Transformation by a Matrix (1/2)

$X \sim \mathcal{N}(\mu, \Sigma)$ and $y = Ax$

- The expectation: $\mathbb{E}[y] = \mathbb{E}[Ax] = A\mathbb{E}[x] = A\mu$.
- The variance: $\mathbb{V}[y] = \mathbb{V}[Ax] = A\mathbb{V}[x]A^\top = A\Sigma A^\top$.
- Thus, we have

$$Y \sim \mathcal{N}(A\mu, A\Sigma A^\top).$$

Linear Transformation by a Matrix (2/2)

Let's consider the *reverse transformation*.

$Y \sim \mathcal{N}(\mu_y, \Sigma)$, $\mathbf{y} = \mathbf{A}\mathbf{x}$ for $\mathbf{x}, \mathbf{y} \in \mathbb{R}^M$, a full rank $\mathbf{A} \in \mathbb{R}^{M \times N}$, $M \geq N$

- $p(\mathbf{y}) = \mathcal{N}(\mathbf{y} \mid \mathbf{A}\mathbf{x}, \Sigma)$.
- **Note:** \mathbf{A} might not be invertible.

Linear Transformation by a Matrix (2/2)

Let's consider the *reverse transformation*.

$Y \sim \mathcal{N}(\mu_y, \Sigma)$, $\mathbf{y} = \mathbf{A}\mathbf{x}$ for $\mathbf{x}, \mathbf{y} \in \mathbb{R}^M$, a full rank $\mathbf{A} \in \mathbb{R}^{M \times N}$, $M \geq N$

- $p(\mathbf{y}) = \mathcal{N}(\mathbf{y} \mid \mathbf{A}\mathbf{x}, \Sigma)$.
 - **Note:** \mathbf{A} might not be invertible.
- $\mathbf{y} = \mathbf{A}\mathbf{x}$

Linear Transformation by a Matrix (2/2)

Let's consider the *reverse transformation*.

$Y \sim \mathcal{N}(\mu_y, \Sigma)$, $\mathbf{y} = \mathbf{A}\mathbf{x}$ for $\mathbf{x}, \mathbf{y} \in \mathbb{R}^M$, a full rank $\mathbf{A} \in \mathbb{R}^{M \times N}$, $M \geq N$

- $p(\mathbf{y}) = \mathcal{N}(\mathbf{y} \mid \mathbf{A}\mathbf{x}, \Sigma)$.
 - **Note:** \mathbf{A} might not be invertible.
- $\mathbf{y} = \mathbf{A}\mathbf{x} \iff \mathbf{A}^\top \mathbf{y} = \mathbf{A}^\top \mathbf{A}\mathbf{x}$

Linear Transformation by a Matrix (2/2)

Let's consider the *reverse transformation*.

$Y \sim \mathcal{N}(\mu_y, \Sigma)$, $\mathbf{y} = \mathbf{A}\mathbf{x}$ for $\mathbf{x}, \mathbf{y} \in \mathbb{R}^M$, a full rank $\mathbf{A} \in \mathbb{R}^{M \times N}$, $M \geq N$

- $p(\mathbf{y}) = \mathcal{N}(\mathbf{y} \mid \mathbf{A}\mathbf{x}, \Sigma)$.
 - **Note:** \mathbf{A} might not be invertible.
- $\mathbf{y} = \mathbf{A}\mathbf{x} \iff \mathbf{A}^\top \mathbf{y} = \mathbf{A}^\top \mathbf{A}\mathbf{x} \iff (\mathbf{A}^\top \mathbf{A})^{-1} \mathbf{A}^\top \mathbf{y} = \mathbf{x}.$

Linear Transformation by a Matrix (2/2)

Let's consider the *reverse transformation*.

$Y \sim \mathcal{N}(\mu_y, \Sigma)$, $\mathbf{y} = \mathbf{A}\mathbf{x}$ for $\mathbf{x}, \mathbf{y} \in \mathbb{R}^M$, a full rank $\mathbf{A} \in \mathbb{R}^{M \times N}$, $M \geq N$

- $p(\mathbf{y}) = \mathcal{N}(\mathbf{y} \mid \mathbf{A}\mathbf{x}, \Sigma)$.
 - **Note:** \mathbf{A} might not be invertible.
- $\mathbf{y} = \mathbf{A}\mathbf{x} \iff \mathbf{A}^\top \mathbf{y} = \mathbf{A}^\top \mathbf{A}\mathbf{x} \iff (\mathbf{A}^\top \mathbf{A})^{-1} \mathbf{A}^\top \mathbf{y} = \mathbf{x}$.
 - This works even for non-invertible \mathbf{A} !

Linear Transformation by a Matrix (2/2)

Let's consider the *reverse transformation*.

$Y \sim \mathcal{N}(\mu_y, \Sigma)$, $\mathbf{y} = \mathbf{A}\mathbf{x}$ for $\mathbf{x}, \mathbf{y} \in \mathbb{R}^M$, a full rank $\mathbf{A} \in \mathbb{R}^{M \times N}$, $M \geq N$

- $p(\mathbf{y}) = \mathcal{N}(\mathbf{y} \mid \mathbf{A}\mathbf{x}, \Sigma)$.
 - **Note:** \mathbf{A} might not be invertible.
- $\mathbf{y} = \mathbf{A}\mathbf{x} \iff \mathbf{A}^\top \mathbf{y} = \mathbf{A}^\top \mathbf{A}\mathbf{x} \iff (\mathbf{A}^\top \mathbf{A})^{-1} \mathbf{A}^\top \mathbf{y} = \mathbf{x}$.
 - This works even for non-invertible \mathbf{A} !
- The variance: $\mathbb{V}[\mathbf{x}] = \mathbb{V}[(\mathbf{A}^\top \mathbf{A})^{-1} \mathbf{A}^\top \mathbf{y}] =$

Linear Transformation by a Matrix (2/2)

Let's consider the *reverse transformation*.

$Y \sim \mathcal{N}(\mu_y, \Sigma)$, $\mathbf{y} = \mathbf{A}\mathbf{x}$ for $\mathbf{x}, \mathbf{y} \in \mathbb{R}^M$, a full rank $\mathbf{A} \in \mathbb{R}^{M \times N}$, $M \geq N$

- $p(\mathbf{y}) = \mathcal{N}(\mathbf{y} \mid \mathbf{A}\mathbf{x}, \Sigma)$.
 - **Note:** \mathbf{A} might not be invertible.
- $\mathbf{y} = \mathbf{A}\mathbf{x} \iff \mathbf{A}^\top \mathbf{y} = \mathbf{A}^\top \mathbf{A}\mathbf{x} \iff (\mathbf{A}^\top \mathbf{A})^{-1} \mathbf{A}^\top \mathbf{y} = \mathbf{x}$.
 - This works even for non-invertible \mathbf{A} !
- The variance: $\mathbb{V}[\mathbf{x}] = \mathbb{V}[(\mathbf{A}^\top \mathbf{A})^{-1} \mathbf{A}^\top \mathbf{y}] = (\mathbf{A}^\top \mathbf{A})^{-1} \mathbf{A}^\top \Sigma \mathbf{A} (\mathbf{A}^\top \mathbf{A})^{-1}$.

Linear Transformation by a Matrix (2/2)

Let's consider the *reverse transformation*.

$Y \sim \mathcal{N}(\mu_y, \Sigma)$, $\mathbf{y} = \mathbf{A}\mathbf{x}$ for $\mathbf{x}, \mathbf{y} \in \mathbb{R}^M$, a full rank $\mathbf{A} \in \mathbb{R}^{M \times N}$, $M \geq N$

- $p(\mathbf{y}) = \mathcal{N}(\mathbf{y} \mid \mathbf{A}\mathbf{x}, \Sigma)$.
 - **Note:** \mathbf{A} might not be invertible.
- $\mathbf{y} = \mathbf{A}\mathbf{x} \iff \mathbf{A}^\top \mathbf{y} = \mathbf{A}^\top \mathbf{A}\mathbf{x} \iff (\mathbf{A}^\top \mathbf{A})^{-1} \mathbf{A}^\top \mathbf{y} = \mathbf{x}$.
 - This works even for non-invertible \mathbf{A} !
- The variance: $\mathbb{V}[\mathbf{x}] = \mathbb{V}[(\mathbf{A}^\top \mathbf{A})^{-1} \mathbf{A}^\top \mathbf{y}] = (\mathbf{A}^\top \mathbf{A})^{-1} \mathbf{A}^\top \Sigma \mathbf{A} (\mathbf{A}^\top \mathbf{A})^{-1}$.
- Thus, we have

Linear Transformation by a Matrix (2/2)

Let's consider the *reverse transformation*.

$Y \sim \mathcal{N}(\mu_y, \Sigma)$, $y = Ax$ for $x, y \in \mathbb{R}^M$, a full rank $A \in \mathbb{R}^{M \times N}$, $M \geq N$

- $p(y) = \mathcal{N}(y \mid Ax, \Sigma)$.
 - **Note:** A might not be invertible.
- $y = Ax \iff A^\top y = A^\top Ax \iff (A^\top A)^{-1} A^\top y = x$.
 - This works even for non-invertible A !
- The variance: $\mathbb{V}[x] = \mathbb{V}[(A^\top A)^{-1} A^\top y] = (A^\top A)^{-1} A^\top \Sigma A (A^\top A)^{-1}$.
- Thus, we have

$$X \sim \mathcal{N}((A^\top A)^{-1} A^\top \mu_y, (A^\top A)^{-1} A^\top \Sigma A (A^\top A)^{-1}).$$

Exercise

Another example of *reverse transformation*.

$Y \sim \mathcal{N}(\mu_y, \Sigma)$ and $\mathbf{y} = \mathbf{A}\mathbf{x}$ for $\mathbf{x}, \mathbf{y} \in \mathbb{R}^M$, and \mathbf{A} is invertible

- $p(\mathbf{y}) = \mathcal{N}(\mathbf{y} \mid \mathbf{A}\mathbf{x}, \Sigma)$.
- Compute $\mathbb{E}[\mathbf{x}]$.
- Compute $\mathbb{V}[\mathbf{x}]$.
- Derive $X \sim \mathcal{N}(?, ?)$.

A Sampling Approach

We want to obtain samples from a multivariate $\mathcal{N}(\boldsymbol{\mu}, \boldsymbol{\Sigma})$.

- However, we only have a sampler of $\mathcal{N}(\mathbf{0}, \mathbf{I})$ at hand.

A Sampling Approach

We want to obtain samples from a multivariate $\mathcal{N}(\boldsymbol{\mu}, \boldsymbol{\Sigma})$.

- However, we only have a sampler of $\mathcal{N}(\mathbf{0}, \mathbf{I})$ at hand.

- Assume that we have $\mathbf{x} \sim \mathcal{N}(\mathbf{0}, \mathbf{I})$.
- Then, define $\mathbf{y} = \mathbf{A}\mathbf{x} + \boldsymbol{\mu}$, where $\mathbf{A}\mathbf{A}^\top = \mathbf{A}\mathbf{A}^\top = \boldsymbol{\Sigma}$.

A Sampling Approach

We want to obtain samples from a multivariate $\mathcal{N}(\boldsymbol{\mu}, \boldsymbol{\Sigma})$.

- However, we only have a sampler of $\mathcal{N}(\mathbf{0}, \mathbf{I})$ at hand.

- Assume that we have $\mathbf{x} \sim \mathcal{N}(\mathbf{0}, \mathbf{I})$.
- Then, define $\mathbf{y} = \mathbf{A}\mathbf{x} + \boldsymbol{\mu}$, where $\mathbf{A}\mathbf{A}^\top = \boldsymbol{\Sigma}$.
- To derive \mathbf{A} :

A Sampling Approach

We want to obtain samples from a multivariate $\mathcal{N}(\boldsymbol{\mu}, \boldsymbol{\Sigma})$.

- However, we only have a sampler of $\mathcal{N}(\mathbf{0}, \mathbf{I})$ at hand.

- Assume that we have $\mathbf{x} \sim \mathcal{N}(\mathbf{0}, \mathbf{I})$.
- Then, define $\mathbf{y} = \mathbf{A}\mathbf{x} + \boldsymbol{\mu}$, where $\mathbf{A}\mathbf{A}^\top = \mathbf{A}\mathbf{A}^\top = \boldsymbol{\Sigma}$.
- To derive \mathbf{A} : Use **Cholesky decomposition** of the covariance matrix $\boldsymbol{\Sigma}$.
 - \mathbf{A} will be triangular and efficient for computation.

- 1 Gaussian Distribution
 - Marginals and Conditionals of Gaussians
 - Sums and Linear Transformations
- 2 Change of Variables
 - Distribution Function Technique
 - Change of Variables

Motivation

Consider the following examples.

- Assuming that X is a random variable distributed according to some well-known distribution, then **what is the distribution of X^2 ?**
- Assuming that X_1, X_2 are two univariate standard normal distributions, then **what is the distribution of $\frac{1}{2}(X_1 + X_2)$?**

Motivation

Consider the following examples.

- Assuming that X is a random variable distributed according to some well-known distribution, then **what is the distribution of X^2 ?**
- Assuming that X_1, X_2 are two univariate standard normal distributions, then **what is the distribution of $\frac{1}{2}(X_1 + X_2)$?**
- What if the transformation is **nonlinear**?

Motivation

Consider the following examples.

- Assuming that X is a random variable distributed according to some well-known distribution, then **what is the distribution of X^2** ?
- Assuming that X_1, X_2 are two univariate standard normal distributions, then **what is the distribution of $\frac{1}{2}(X_1 + X_2)$** ?
- What if the transformation is **nonlinear**?
 - Closed-form expressions are not readily available.

Straightforward for Discrete Random Variables

Example: Univariate Random Variables

Given

- A discrete random variable X with pmf $\Pr[X = x]$.
- An invertible function $U(x)$.

Consider the transformed random variable $Y := U(X)$ with pmf $\Pr[Y = y]$. Then

$$\begin{aligned}\Pr[Y = y] &= \Pr[U(X) = y] && \text{(transformation of interest)} \\ &= \Pr[X = U^{-1}(y)] && \text{(inverse)}\end{aligned}$$

where we can observe $x = U^{-1}(y)$.

Two Approaches

- So far we considered the discrete case (e.g., $\Pr[X = x]$).
- For continuous distributions, we will consider the two approaches:
 - ① Cumulative distribution (Distribution Function Technique).
 - ② Change-of-variable.

Outline

- 1 Gaussian Distribution
 - Marginals and Conditionals of Gaussians
 - Sums and Linear Transformations
- 2 Change of Variables
 - Distribution Function Technique
 - Change of Variables

Distribution Function Technique

Note: a cdf of X : $F_X(x) = \Pr[X \leq x]$.

Goal: Find the cdf of the random variable $Y := U(X)$

- 1 Find the cdf

$$F_Y(y) = \Pr[Y \leq y].$$

- 2 Differentiating $F_Y(y)$ to get the pdf $f_Y(y)$:

$$f_Y(y) = \frac{d}{dy} F_Y(y).$$

Distribution Function Technique

Note: a cdf of X : $F_X(x) = \Pr[X \leq x]$.

Goal: Find the cdf of the random variable $Y := U(X)$

- 1 Find the cdf

$$F_Y(y) = \Pr[Y \leq y].$$

- 2 Differentiating $F_Y(y)$ to get the pdf $f_Y(y)$:

$$f_Y(y) = \frac{d}{dy} F_Y(y).$$

Note: The domain of the random variable may have changed!

Example

Example

Let X be a continuous random variable with pdf $f_X : [0, 1] \mapsto [0, 1]$:

$$f_X(x) = 3x^2.$$

Goal: Find the pdf of $Y = X^2$.

$$F_Y(y) = \Pr[Y \leq y]$$

Example

Example

Let X be a continuous random variable with pdf $f_X : [0, 1] \mapsto [0, 1]$:

$$f_X(x) = 3x^2.$$

Goal: Find the pdf of $Y = X^2$.

$$\begin{aligned} F_Y(y) &= \Pr[Y \leq y] = \Pr[X^2 \leq y] \\ &= \Pr[X \leq y^{\frac{1}{2}}] \\ &= F_X(y^{\frac{1}{2}}) \end{aligned}$$

Example

Example

Let X be a continuous random variable with pdf $f_X : [0, 1] \mapsto [0, 1]$:

$$f_X(x) = 3x^2.$$

Goal: Find the pdf of $Y = X^2$.

$$\begin{aligned} F_Y(y) &= \Pr[Y \leq y] = \Pr[X^2 \leq y] \\ &= \Pr[X \leq y^{\frac{1}{2}}] \\ &= F_X(y^{\frac{1}{2}}) = \int_0^{y^{\frac{1}{2}}} 3t^2 dt \\ &= [t^3]_0^{y^{\frac{1}{2}}} = y^{\frac{3}{2}}, \quad 0 \leq y \leq 1. \end{aligned}$$

Example

Example

Let X be a continuous random variable with pdf $f_X : [0, 1] \mapsto [0, 1]$:

$$f_X(x) = 3x^2.$$

Goal: Find the pdf of $Y = X^2$.

$$\begin{aligned} F_Y(y) &= \Pr[Y \leq y] = \Pr[X^2 \leq y] && \text{Thus,} \\ &= \Pr[X \leq y^{\frac{1}{2}}] && f_Y(y) = \frac{d}{dy} F_Y(y) = \frac{3}{2} y^{\frac{1}{2}} \\ &= F_X(y^{\frac{1}{2}}) = \int_0^{y^{\frac{1}{2}}} 3t^2 dt && \text{for } 0 \leq y \leq 1. \\ &= [t^3]_0^{y^{\frac{1}{2}}} = y^{\frac{3}{2}}, \quad 0 \leq y \leq 1. \end{aligned}$$

Exercise

Theorem [Casella & Berger (2002)]

Let X be a continuous random variable with a *strictly monotone* cumulative distribution function $F_X(x)$. Then, the random variable Y defined as

$$Y := F_X(X)$$

has a **uniform distribution**.

Exercise

Consider $f_X(x) = 3x^2$ in the previous example. Show that $Y := F_X(X)$ attains a uniform distribution.

Remark

The first approach relies on the following facts:

- We can transform the cdf of Y into an expression that is a cdf of X .
- We can differentiate the cdf to obtain the pdf.

Outline

- 1 Gaussian Distribution
 - Marginals and Conditionals of Gaussians
 - Sums and Linear Transformations
- 2 Change of Variables
 - Distribution Function Technique
 - Change of Variables

What We have Learnt From the Calculus Course

$$\int f(g(x))g'(x)dx = \int f(u)du, \text{ where } u = g(x).$$

What We have Learnt From the Calculus Course

$$\int f(g(x))g'(x)dx = \int f(u)du, \text{ where } u = g(x).$$

- Intuitively, considering $du \approx \Delta u = g'(x)\Delta x$ as the “small changes”.

The Roadmap (1/2)

- Consider a univariate random variable X and an invertible function U such that $Y := U(X)$.
- Assume that X has states $x \in [a, b]$.
- By the definition of a cdf, we have

The Roadmap (1/2)

- Consider a univariate random variable X and an invertible function U such that $Y := U(X)$.
- Assume that X has states $x \in [a, b]$.
- By the definition of a cdf, we have

$$F_Y(y) = \Pr[Y \leq y]$$

The Roadmap (1/2)

- Consider a univariate random variable X and an invertible function U such that $Y := U(X)$.
- Assume that X has states $x \in [a, b]$.
- By the definition of a cdf, we have

$$F_Y(y) = \Pr[Y \leq y] = \Pr[U(X) \leq y]$$

The Roadmap (1/2)

- Consider a univariate random variable X and an invertible function U such that $Y := U(X)$.
- Assume that X has states $x \in [a, b]$.
- By the definition of a cdf, we have

$$F_Y(y) = \Pr[Y \leq y] = \Pr[U(X) \leq y]$$

If U is *strictly increasing*, then so is its inverse U^{-1} .

$$\Pr[U(X) \leq y] = \Pr[U^{-1}(U(X)) \leq U^{-1}(y)]$$

The Roadmap (1/2)

- Consider a univariate random variable X and an invertible function U such that $Y := U(X)$.
- Assume that X has states $x \in [a, b]$.
- By the definition of a cdf, we have

$$F_Y(y) = \Pr[Y \leq y] = \Pr[U(X) \leq y]$$

If U is *strictly increasing*, then so is its inverse U^{-1} .

$$\Pr[U(X) \leq y] = \Pr[U^{-1}(U(X)) \leq U^{-1}(y)] = \Pr[X \leq U^{-1}(y)].$$

$$\text{Then, } F_Y(y) = \Pr[X \leq U^{-1}(y)] = \int_a^{U^{-1}(y)} f_X(x) dx$$

The Roadmap (2/2)

- To obtain the pdf, we differentiate $F_Y(y)$ w.r.t. y :

$$f_Y(y) = \frac{d}{dy} F_Y(y) = \frac{d}{dy} \int_a^{U^{-1}(y)} f_X(x) dx.$$

The Roadmap (2/2)

- To obtain the pdf, we differentiate $F_Y(y)$ w.r.t. y :

$$f_Y(y) = \frac{d}{dy} F_Y(y) = \frac{d}{dy} \int_a^{U^{-1}(y)} f_X(x) dx.$$

- The integral on the right-hand side is w.r.t. x , but we need an integral **w.r.t. y** (\because we are differentiating w.r.t. y ...)
- Change-of-variable comes to the rescue!

The Roadmap (2/2)

- To obtain the pdf, we differentiate $F_Y(y)$ w.r.t. y :

$$f_Y(y) = \frac{d}{dy} F_Y(y) = \frac{d}{dy} \int_a^{U^{-1}(y)} f_X(x) dx.$$

- The integral on the right-hand side is w.r.t. x , but we need an integral **w.r.t. y** (\because we are differentiating w.r.t. y ...)
 - Change-of-variable comes to the rescue!
- $\int f_X(U^{-1}(y)) U^{-1'}(y) dy = \int f_X(x) dx$, where $x = U^{-1}(y)$.

The Roadmap (2/2)

- To obtain the pdf, we differentiate $F_Y(y)$ w.r.t. y :

$$f_Y(y) = \frac{d}{dy} F_Y(y) = \frac{d}{dy} \int_a^{U^{-1}(y)} f_X(x) dx.$$

- The integral on the right-hand side is w.r.t. x , but we need an integral **w.r.t. y** (\because we are differentiating w.r.t. y ...)
- Change-of-variable comes to the rescue!

- $\int f_X(U^{-1}(y)) U^{-1}'(y) dy = \int f_X(x) dx$, where $x = U^{-1}(y)$.

- Thus,

$$\begin{aligned} f_Y(y) &= \frac{d}{dy} \int_a^{U^{-1}(y)} f_X(U^{-1}(y)) U^{-1}'(y) dy \\ &= f_X(U^{-1}(y)) \cdot \left(\frac{d}{dy} U^{-1}(y) \right). \end{aligned}$$

Remark

For decreasing functions,

$$f_Y(y) = -f_X(U^{-1}(y)) \cdot \left(\frac{d}{dy} U^{-1}(y) \right).$$

Remark

For decreasing functions,

$$f_Y(y) = -f_X(U^{-1}(y)) \cdot \left(\frac{d}{dy} U^{-1}(y) \right).$$

So for both increasing and decreasing U ,

$$f_Y(y) = f_X(U^{-1}(y)) \cdot \left| \frac{d}{dy} U^{-1}(y) \right|.$$

Remark

For decreasing functions,

$$f_Y(y) = -f_X(U^{-1}(y)) \cdot \left(\frac{d}{dy} U^{-1}(y) \right).$$

So for both increasing and decreasing U ,

$$f_Y(y) = f_X(U^{-1}(y)) \cdot \left| \frac{d}{dy} U^{-1}(y) \right|.$$

- The term $\left| \frac{d}{dy} U^{-1}(y) \right|$ measures how much a unit volume changes when applying U .

The Main Theorem

Theorem [Billingsley (1995)]

Let $f_X(\mathbf{x})$ be the pdf of the multivariate continuous random variable X . If the **vector-valued** function $\mathbf{y} = U(\mathbf{x})$ is **differentiable** and **invertible** for all values within the domain of \mathbf{x} , then for corresponding values of \mathbf{y} , the pdf of $Y = U(X)$ is given by

$$f(\mathbf{y}) = f_{\mathbf{x}}(U^{-1}(\mathbf{y})) \cdot \left| \det \left(\frac{\partial}{\partial \mathbf{y}} U^{-1}(\mathbf{y}) \right) \right|.$$

Example

Example

Consider a bivariate random variable X with states $\mathbf{x} = \begin{bmatrix} x_1 \\ x_2 \end{bmatrix}$ and pdf

$$f\left(\begin{bmatrix} x_1 \\ x_2 \end{bmatrix}\right) = \frac{1}{2\pi} \exp\left(-\frac{1}{2} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix}^\top \begin{bmatrix} x_1 \\ x_2 \end{bmatrix}\right).$$

Then, consider a matrix $\mathbf{A} \in \mathbb{R}^{2 \times 2}$ defined as

$$\mathbf{A} = \begin{bmatrix} a & b \\ c & d \end{bmatrix}.$$

Goal: Find the pdf of the random variable Y with states $\mathbf{y} = \mathbf{A}\mathbf{x}$.

- $\mathbf{y} = \mathbf{A}\mathbf{x}$

$$\bullet \mathbf{y} = \mathbf{Ax} \implies \mathbf{x} = \mathbf{A}^{-1}\mathbf{y}.$$

$$\begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \mathbf{A}^{-1} \begin{bmatrix} y_1 \\ y_2 \end{bmatrix}$$

$$\bullet \mathbf{y} = \mathbf{A}\mathbf{x} \implies \mathbf{x} = \mathbf{A}^{-1}\mathbf{y}.$$

$$\begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \mathbf{A}^{-1} \begin{bmatrix} y_1 \\ y_2 \end{bmatrix} = \frac{1}{ad - bc} \begin{bmatrix} d & -b \\ -c & a \end{bmatrix} \begin{bmatrix} y_1 \\ y_2 \end{bmatrix}.$$

- $\mathbf{y} = \mathbf{A}\mathbf{x} \implies \mathbf{x} = \mathbf{A}^{-1}\mathbf{y}.$

$$\begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \mathbf{A}^{-1} \begin{bmatrix} y_1 \\ y_2 \end{bmatrix} = \frac{1}{ad - bc} \begin{bmatrix} d & -b \\ -c & a \end{bmatrix} \begin{bmatrix} y_1 \\ y_2 \end{bmatrix}.$$

- The corresponding pdf is given by

$$f(\mathbf{x}) = f(\mathbf{A}^{-1}\mathbf{y}) = \frac{1}{2\pi} \exp \left(-\frac{1}{2} \mathbf{y}^\top (\mathbf{A}^{-1})^\top \mathbf{A}^{-1} \mathbf{y} \right)$$

- $\mathbf{y} = \mathbf{A}\mathbf{x} \implies \mathbf{x} = \mathbf{A}^{-1}\mathbf{y}.$

$$\begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \mathbf{A}^{-1} \begin{bmatrix} y_1 \\ y_2 \end{bmatrix} = \frac{1}{ad - bc} \begin{bmatrix} d & -b \\ -c & a \end{bmatrix} \begin{bmatrix} y_1 \\ y_2 \end{bmatrix}.$$

- The corresponding pdf is given by

$$f(\mathbf{x}) = f(\mathbf{A}^{-1}\mathbf{y}) = \frac{1}{2\pi} \exp \left(-\frac{1}{2} \mathbf{y}^\top (\mathbf{A}^{-1})^\top \mathbf{A}^{-1} \mathbf{y} \right)$$

- $\frac{\partial}{\partial \mathbf{y}} \mathbf{A}^{-1} \mathbf{y} =$

- $\mathbf{y} = \mathbf{A}\mathbf{x} \implies \mathbf{x} = \mathbf{A}^{-1}\mathbf{y}.$

$$\begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \mathbf{A}^{-1} \begin{bmatrix} y_1 \\ y_2 \end{bmatrix} = \frac{1}{ad - bc} \begin{bmatrix} d & -b \\ -c & a \end{bmatrix} \begin{bmatrix} y_1 \\ y_2 \end{bmatrix}.$$

- The corresponding pdf is given by

$$f(\mathbf{x}) = f(\mathbf{A}^{-1}\mathbf{y}) = \frac{1}{2\pi} \exp \left(-\frac{1}{2} \mathbf{y}^\top (\mathbf{A}^{-1})^\top \mathbf{A}^{-1} \mathbf{y} \right)$$

- $\frac{\partial}{\partial \mathbf{y}} \mathbf{A}^{-1} \mathbf{y} = \mathbf{A}^{-1}$. So, $\det \left(\frac{\partial}{\partial \mathbf{y}} \mathbf{A}^{-1} \mathbf{y} \right) = \det(\mathbf{A}^{-1}) =$

- $\mathbf{y} = \mathbf{A}\mathbf{x} \implies \mathbf{x} = \mathbf{A}^{-1}\mathbf{y}.$

$$\begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \mathbf{A}^{-1} \begin{bmatrix} y_1 \\ y_2 \end{bmatrix} = \frac{1}{ad - bc} \begin{bmatrix} d & -b \\ -c & a \end{bmatrix} \begin{bmatrix} y_1 \\ y_2 \end{bmatrix}.$$

- The corresponding pdf is given by

$$f(\mathbf{x}) = f(\mathbf{A}^{-1}\mathbf{y}) = \frac{1}{2\pi} \exp\left(-\frac{1}{2}\mathbf{y}^\top (\mathbf{A}^{-1})^\top \mathbf{A}^{-1}\mathbf{y}\right)$$

- $\frac{\partial}{\partial \mathbf{y}} \mathbf{A}^{-1}\mathbf{y} = \mathbf{A}^{-1}$. So, $\det\left(\frac{\partial}{\partial \mathbf{y}} \mathbf{A}^{-1}\mathbf{y}\right) = \det(\mathbf{A}^{-1}) = \frac{1}{ad - bc}.$

- $\mathbf{y} = \mathbf{A}\mathbf{x} \implies \mathbf{x} = \mathbf{A}^{-1}\mathbf{y}.$

$$\begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \mathbf{A}^{-1} \begin{bmatrix} y_1 \\ y_2 \end{bmatrix} = \frac{1}{ad - bc} \begin{bmatrix} d & -b \\ -c & a \end{bmatrix} \begin{bmatrix} y_1 \\ y_2 \end{bmatrix}.$$

- The corresponding pdf is given by

$$f(\mathbf{x}) = f(\mathbf{A}^{-1}\mathbf{y}) = \frac{1}{2\pi} \exp\left(-\frac{1}{2}\mathbf{y}^\top (\mathbf{A}^{-1})^\top \mathbf{A}^{-1}\mathbf{y}\right)$$

- $\frac{\partial}{\partial \mathbf{y}} \mathbf{A}^{-1}\mathbf{y} = \mathbf{A}^{-1}$. So, $\det\left(\frac{\partial}{\partial \mathbf{y}} \mathbf{A}^{-1}\mathbf{y}\right) = \det(\mathbf{A}^{-1}) = \frac{1}{ad - bc}.$

- Thus, $f(\mathbf{y}) = \frac{1}{2\pi} \exp\left(-\frac{1}{2}\mathbf{y}^\top (\mathbf{A}^{-1})^\top \mathbf{A}^{-1}\mathbf{y}\right) \cdot \left|\frac{1}{ad - bc}\right|.$
