

# Auctions & Mechanism Design Basics

Joseph Chuang-Chieh Lin

Department of Computer Science & Engineering,  
National Taiwan Ocean University

Fall 2024

- We study about a kind of science of *rule-making*.
- To make it simple, we first consider single-item auctions.
- We will go over some basics about first-price auctions and second-price auctions.
- Also, we will talk about
  - incentive guarantees,
  - strong performance guarantees, and
  - computational efficiencyin an auction.
- We will end the discussion with Myerson's Lemma.

# Outline

# First-Price auction

## First-Price

The winning bidder **pays her bid.**

- But it's hard to reason about.

# First-Price auction

## First-Price

The winning bidder **pays her bid.**

- But it's hard to reason about.
- Why?

# Issues of the First-Price Auctions

- For a bidder:

# Issues of the First-Price Auctions

- For a bidder: Hard to figure how to bid.

# Issues of the First-Price Auctions

- For a bidder: Hard to figure how to bid.
- For the seller:

# Issues of the First-Price Auctions

- For a bidder: Hard to figure how to bid.
- For the seller: Hard to predict what will happen.

# An Example

- Suppose that you are participating in the first-price auction.
- Your valuation for the item: the number of your birth month + the day of your birth.

# An Example

- Suppose that you are participating in the first-price auction.
- Your valuation for the item: **the number of your birth month + the day of your birth.**
  - Your valuation is between 2 and 43.

# An Example

- Suppose that you are participating in the first-price auction.
- Your valuation for the item: **the number of your birth month + the day of your birth.**
  - Your valuation is between 2 and 43.
- Suppose that there is another bidder who has the same valuation like you.

# An Example

- Suppose that you are participating in the first-price auction.
- Your valuation for the item: **the number of your birth month + the day of your birth.**
  - Your valuation is between 2 and 43.
- Suppose that there is another bidder who has the same valuation like you.
  - Would it help to know your opponent's birthday?

# An Example

- Suppose that you are participating in the first-price auction.
- Your valuation for the item: **the number of your birth month + the day of your birth.**
  - Your valuation is between 2 and 43.
- Suppose that there is another bidder who has the same valuation like you.
  - Would it help to know your opponent's birthday?
  - Would your answer change if you knew there were two other bidders rather than one?

## 2 Sealed-Bid Auctions

- First-Price Auctions
- **Second-Price Auctions**
- Case Study: Sponsored Search Auctions

# eBay/Yahoo auction

- If you bid \$100 and win, do you pay \$100?

# eBay/Yahoo auction

- If you bid \$100 and win, do you pay \$100?
    - eBay increases your bid on your behalf until
      - Your maximum bid is reached, or
      - You are the highest bidder
- whichever comes first.

# eBay/Yahoo auction

- If you bid \$100 and win, do you pay \$100?
  - eBay increases your bid on your behalf until
    - Your maximum bid is reached, or
    - You are the highest bidderwhichever comes first.
  - For example, if the highest other bid is \$90.  
You only pay  $\$90 + \epsilon$  for some small increment  $\epsilon$ .  
 $\approx$  highest other bid!

# Second-Price auction

## Second-Price/Vickrey Auction

The highest bidder wins and pays a price equal to the **second-highest bid**.

- Is such a strategy a **dominant strategy**?

# Second-Price auction

## Second-Price/Vickrey Auction

The highest bidder wins and pays a price equal to the **second-highest bid**.

- Is such a strategy a **dominant strategy**?
  - The strategy is guaranteed to **maximize** a bidder's utility **no matter what other bidders do**.

# Truthfully Bidding Is Dominant Here

## Proposition (Incentives in Second-Price Auctions)

In a second-price auction, every bidder  $i$  has a dominant strategy: set the bid  $b_i = v_i$ , equal to her private valuation.

# Proof of the Proposition

- Fix a bidder  $i$  with valuation  $v_i$ .
  - $\mathbf{b}$ : the vector of all bids.
  - $\mathbf{b}_{-i}$ : the vector of  $\mathbf{b}$  with  $b_i$  removed.
- \* **Goal:** Show that bidder  $i$ 's utility is maximized by setting  $b_i = v_i$ .

# Proof of the Proposition (contd.)

- Let  $B := \max_{j \neq i} b_j$  denote the highest bid by some other bidder.

# Proof of the Proposition (contd.)

- Let  $B := \max_{j \neq i} b_j$  denote the highest bid by some other bidder.
- If  $b_i < B$ , then

# Proof of the Proposition (contd.)

- Let  $B := \max_{j \neq i} b_j$  denote the highest bid by some other bidder.
- If  $b_i < B$ , then  $i$  loses and receive utility

# Proof of the Proposition (contd.)

- Let  $B := \max_{j \neq i} b_j$  denote the highest bid by some other bidder.
- If  $b_i < B$ , then  $i$  loses and receive utility 0.
- If  $b_i \geq B$ , then  $i$

# Proof of the Proposition (contd.)

- Let  $B := \max_{j \neq i} b_j$  denote the highest bid by some other bidder.
- If  $b_i < B$ , then  $i$  loses and receive utility 0.
- If  $b_i \geq B$ , then  $i$  wins at price

# Proof of the Proposition (contd.)

- Let  $B := \max_{j \neq i} b_j$  denote the highest bid by some other bidder.
- If  $b_i < B$ , then  $i$  loses and receive utility 0.
- If  $b_i \geq B$ , then  $i$  wins at price  $B$  and receives utility

## Proof of the Proposition (contd.)

- Let  $B := \max_{j \neq i} b_j$  denote the highest bid by some other bidder.
- If  $b_i < B$ , then  $i$  loses and receive utility 0.
- If  $b_i \geq B$ , then  $i$  wins at price  $B$  and receives utility  $v_i - B$ .

# Proof of the Proposition (contd.)

- Let  $B := \max_{j \neq i} b_j$  denote the highest bid by some other bidder.
- If  $b_i < B$ , then  $i$  loses and receive utility 0.
- If  $b_i \geq B$ , then  $i$  wins at price  $B$  and receives utility  $v_i - B$ .
- Then, we consider two cases:

# Proof of the Proposition (contd.)

- Let  $B := \max_{j \neq i} b_j$  denote the highest bid by some other bidder.
- If  $b_i < B$ , then  $i$  loses and receive utility 0.
- If  $b_i \geq B$ , then  $i$  wins at price  $B$  and receives utility  $v_i - B$ .
- Then, we consider two cases:
  - If  $v_i < B$ , the maximum utility that bidder  $i$  can obtain is

## Proof of the Proposition (contd.)

- Let  $B := \max_{j \neq i} b_j$  denote the highest bid by some other bidder.
- If  $b_i < B$ , then  $i$  loses and receive utility 0.
- If  $b_i \geq B$ , then  $i$  wins at price  $B$  and receives utility  $v_i - B$ .
- Then, we consider two cases:
  - If  $v_i < B$ , the maximum utility that bidder  $i$  can obtain is  $\max\{0, v_i - B\} = 0$ .

## Proof of the Proposition (contd.)

- Let  $B := \max_{j \neq i} b_j$  denote the highest bid by some other bidder.
- If  $b_i < B$ , then  $i$  loses and receive utility 0.
- If  $b_i \geq B$ , then  $i$  wins at price  $B$  and receives utility  $v_i - B$ .
- Then, we consider two cases:
  - If  $v_i < B$ , the maximum utility that bidder  $i$  can obtain is  $\max\{0, v_i - B\} = 0$ .
    - ⇒ Bid **truthfully** (and then loses).

# Proof of the Proposition (contd.)

- Let  $B := \max_{j \neq i} b_j$  denote the highest bid by some other bidder.
- If  $b_i < B$ , then  $i$  loses and receive utility 0.
- If  $b_i \geq B$ , then  $i$  wins at price  $B$  and receives utility  $v_i - B$ .
- Then, we consider two cases:
  - If  $v_i < B$ , the maximum utility that bidder  $i$  can obtain is  $\max\{0, v_i - B\} = 0$ .
    - ⇒ Bid **truthfully** (and then loses).
  - If  $v_i \geq B$ , the maximum utility that bidder  $i$  can obtain is

# Proof of the Proposition (contd.)

- Let  $B := \max_{j \neq i} b_j$  denote the highest bid by some other bidder.
- If  $b_i < B$ , then  $i$  loses and receive utility 0.
- If  $b_i \geq B$ , then  $i$  wins at price  $B$  and receives utility  $v_i - B$ .
- Then, we consider two cases:
  - If  $v_i < B$ , the maximum utility that bidder  $i$  can obtain is  $\max\{0, v_i - B\} = 0$ .  
     $\Rightarrow$  Bid **truthfully** (and then loses).
  - If  $v_i \geq B$ , the maximum utility that bidder  $i$  can obtain is  $\max\{0, v_i - B\} = v_i - B$ .

## Proof of the Proposition (contd.)

- Let  $B := \max_{j \neq i} b_j$  denote the highest bid by some other bidder.
- If  $b_i < B$ , then  $i$  loses and receive utility 0.
- If  $b_i \geq B$ , then  $i$  wins at price  $B$  and receives utility  $v_i - B$ .
- Then, we consider two cases:
  - If  $v_i < B$ , the maximum utility that bidder  $i$  can obtain is  $\max\{0, v_i - B\} = 0$ .  
⇒ Bid **truthfully** (and then loses).
  - If  $v_i \geq B$ , the maximum utility that bidder  $i$  can obtain is  $\max\{0, v_i - B\} = v_i - B$ .  
⇒ Bid **truthfully** (and then wins).

# Nonnegative Utility Here

## Proposition 2 (Nonnegative Utility)

In a second-price auction, every truthfully bidder is guaranteed nonnegative utility.

- Losers receive utility 0.
- How about the winners?

# Nonnegative Utility Here

## Proposition 2 (Nonnegative Utility)

In a second-price auction, every truthfully bidder is guaranteed nonnegative utility.

- Losers receive utility 0.
- How about the winners?
  - The utility is  $v_i - p$ , where  $p$  is the 2nd highest bid.

# Nonnegative Utility Here

## Proposition 2 (Nonnegative Utility)

In a second-price auction, every truthfully bidder is guaranteed nonnegative utility.

- Losers receive utility 0.
- How about the winners?
  - The utility is  $v_i - p$ , where  $p$  is the 2nd highest bid.
  - $\therefore$  bidder  $i$  wins and bids her true valuation  $v_i$ , so  $p \leq v_i$

# Nonnegative Utility Here

## Proposition 2 (Nonnegative Utility)

In a second-price auction, every truthfully bidder is guaranteed nonnegative utility.

- Losers receive utility 0.
- How about the winners?
  - The utility is  $v_i - p$ , where  $p$  is the 2nd highest bid.
  - $\therefore$  bidder  $i$  wins and bids her true valuation  $v_i$ , so  $p \leq v_i \Rightarrow v_i - p \geq 0$ .

# Second-Price Single-Item Auctions are “ideal”

## Definition (Dominant-Strategy Incentive Compatible)

An auction is **dominant-strategy incentive compatible (DSIC)** if

- truthful bidding is a dominant strategy for every bidder, and
- truthful bidders always obtain nonnegative utility.

# Second-Price Single-Item Auctions are “ideal”

## Definition (Dominant-Strategy Incentive Compatible)

An auction is **dominant-strategy incentive compatible (DSIC)** if

- truthful bidding is a dominant strategy for every bidder, and
- truthful bidders always obtain nonnegative utility.

## Social Welfare

The **social welfare** of an outcome of a single-item auction is

$$\sum_{i=1}^n v_i x_i.$$

where  $\sum_{i=1}^n x_i \leq 1$ ;  $x_i = 1$  if bidder  $i$  wins and 0 if she loses.

# Second-Price Single-Item Auctions are “ideal” (contd.)

## Social Welfare

The **social welfare** of an outcome of a single-item auction is

$$\sum_{i=1}^n v_i x_i.$$

where  $\sum_{i=1}^n x_i \leq 1$ ;  $x_i = 1$  if bidder  $i$  wins and 0 if she loses.

- So such an auction is welfare maximizing if bids are truthful.

# Second-Price Single-Item Auctions are “ideal” (contd.)

## Theorem

A second-price single-item auction satisfies:

- (1) DSIC.
- (2) Welfare maximizing.
- (3) It can be implemented in polynomial time.

In fact, (3) is linear.

# Second-Price Single-Item Auctions are “ideal” (contd.)

## Theorem

A second-price single-item auction satisfies:

- (1) DSIC. (strong incentive guarantees)
- (2) Welfare maximizing. (strong performance guarantees)
- (3) It can be implemented in polynomial time. (computational efficiency)

In fact, (3) is linear.

# Outline

# Background

## The Social Dilemma (2020) - Trailer

- Web search results:
  - relevant to your query (by an algorithm, e.g., PageRank).
  - pops out a list of sponsored links.
    - They are paid by advertisers.
- Every time you give a search query into a search engine, an auction is run in real time to decide
  - which advertiser's links are shown,
  - how these links are arranged visually,
  - what the advertisers are charged.

# Multiple Items for Sponsored Search Auctions

- Let's say the items for sale are  $k$  “slots” on a search results page.
- Bidders: the advertisers who have a bid on the keyword that was searched on.
  - On the keyword, “university”, NTU, NYCU, NCKU, TKU, etc., might be the bidders.

# Multiple Items for Sponsored Search Auctions

  - $x_i$ : the CTR of the slot to which bidder  $i$  is assigned.
    - $x_i = 0$ : bidder  $i$  is not assigned to a slot.
  - Each slot can only be assigned to one bidder; each bidder gets only one slot.

# Our Design Approach

- Who wins what?
- Who pays what?
- The payment.

# Our Design Approach

- Who wins what?
- Who pays what?
- The payment.
  - If the payments are not just right, then the strategic bidders will game the system.

# Our Design Approach

## Design Steps

- (a): Assume that the bidders bid truthfully. Then, how should we assign bidders to slots so that property (2) and (3) holds?
- (b): Given the answer of above, how should we set selling prices so that property (1) holds?

# Step (a)

- Given truthful bids. For  $i = 1, 2, \dots, k$ , assign the  $i$ th highest bid to the  $i$ th best slot.

# Step (a)

- Given truthful bids. For  $i = 1, 2, \dots, k$ , assign the  $i$ th highest bid to the  $i$ th best slot.
- You can prove that this assignment achieves the maximum social welfare as an exercise.

# Step (b)

- There is an analog of the second-price rule.
  - DSIC.
  - ★ Myerson's lemma.

# Step (b)

- There is an analog of the second-price rule.
  - DSIC.
  - ★ Myerson's lemma.
    - A powerful and general tool for implementing this second step.
