# Revenue-Maximizing Auctions

Joseph Chuang-Chieh Lin

Dept. Computer Science and Engineering,
National Taiwan Ocean University
Taiwan

- ► In previous lectures, we only focus on maximizing the social welfare, while revenue is generated only as a side effect.
  - ► Though, indeed, there are real-world scenarios that the primary objective is welfare maximization (i.e., government auctions)
- In this lecture, we:
  - ▶ Study mechanisms that are designed to raise as much revenue as possible.
  - Characterize the expected revenue-maximizing mechanisms with respect to a prior distribution over agents' valuations.

Joseph C.-C. Lin CSE, NTOU, TW 2 / 42

# A trivial example

- ightharpoonup Suppose that there is one item and only one bidder, with private valuation v.
- ▶ The direct-revelation DSIC auction: take-it-or-leave-it.
  - With a posted price  $r \ge 0$ , the auction's revenue is either r (if  $v \ge r$ ) or 0 (if v < r).
- ► Maximizing social welfare is trivial:
  - ▶ Set r := 0.
  - ► Independent of *v*.

Joseph C.-C. Lin CSE, NTOU, TW 5 / 42

  - Note the difficulty: v is private.
  - Let's consider another point of view: Bayesian analysis.

Joseph C.-C. Lin CSE, NTOU, TW 5 / 42

#### The Challenge of Revenue Maximization

## Bayesian Analysis

Joseph C.-C. Lin CSE, NTOU, TW 6 / 42

# Bayesian Environment

#### Bayesian Environment

- A single-parameter environment. Assume that there is a constant M such that  $x_i \leq M$  for every i and feasible solution  $(x_1, \ldots, x_n) \in X$ .
- Independent distributions  $F_1, \ldots, F_n$  with positive and continuous density functions  $f_1, \ldots, f_n$ . Assume that the private valuation  $v_i$  of participant i is drawn from  $F_i$ .
  - Also, assume that the support of every distribution  $F_i$  belongs to  $[0, v_{\text{max}}]$  for some  $v_{\text{max}} < \infty$ .
- \* The mechanism designer knows the distributions  $F_1, \ldots, F_n$ .
- $\star$  The realizations  $v_1, \ldots, v_n$  of agents' valuations are still private.

Joseph C.-C. Lin CSE, NTOU, TW 7 / 42

# The goal now

- Among all DSIC mechanisms, the optimal mechanism is the one having the highest expected revenue (assuming truthful bids).
  - ▶ The expectation is w.r.t.  $F_1 \times F_2 \times \cdots \times F_n$  over valuation profiles.
- ▶ The expected revenue of a posted price r is then

$$r \cdot (1 - F(r)),$$

where r represents the revenue of a sale while (1 - F(r)) represents the probability of a sale.

▶ Solve for the best posted price  $r^* \Rightarrow$  a monopoly price.

Joseph C.-C. Lin CSE, NTOU, TW 8 / 42

# The goal now

Proof of the Main Lemma (5.1)

#### Goal

An explicit description of an optimal (i.e., expected revenue-maximizing) DSIC mechanism for every single-parameter environment and distributions  $F_1, \ldots, F_n$ .

Joseph C.-C. Lin CSE, NTOU, TW 12 / 42

#### Recall

▶ Every DSIC mechanism is equivalent to a direct-revelation DSIC mechanism.

#### The Revelation Principle

#### Theorem (Revelation Principle for DSIC Mechanisms)

For every mechanism M where every participant always has a dominant strategy, there is an equivalent direct-revelation DSIC mechanism M'.

 $\blacktriangleright$  We use a simulation argument to construct M' as follows.

Joseph C.-C. Lin CSE, NTOU, TW 13 / 42

#### Recall

- ▶ Every DSIC mechanism is equivalent to a direct-revelation DSIC mechanism.
- ▶ Hence we can pay our attention to such mechanisms.
- Assume truthful bids for the rest of our discussions.
  - $\triangleright b = v$ .

Joseph C.-C. Lin CSE, NTOU, TW 13 / 42

# Expected revenue of a DSIC mechanism (x, p)

▶ The expected revenue of a DSIC mechanism (x, p) is

$$\mathsf{E}_{\mathbf{v}\sim\mathbf{F}}\left[\sum_{i=1}^n p_i(\mathbf{v})\right],$$

where the expectation is w.r.t.  $\boldsymbol{F} = F_1 \times \cdots \times F_n$  over agents' valuations.

Joseph C.-C. Lin CSE, NTOU, TW 14 / 42

# Expected revenue of a DSIC mechanism (x, p)

▶ The expected revenue of a DSIC mechanism (x, p) is

$$\mathbf{E}_{\mathbf{v}\sim\mathbf{F}}\left[\sum_{i=1}^n p_i(\mathbf{v})\right],$$

where the expectation is w.r.t.  $\mathbf{F} = F_1 \times \cdots \times F_n$  over agents' valuations.

- ▶ It's unclear how to maximize this expression...
- Later we will consider an alternative formula which only references the allocation rule of a mechanism.

## Virtual Valuations

#### Virtual Valuation

For an agent i with valuation distribution  $F_i$  and valuation  $v_i$  (drawn from  $F_i$ ), her virtual valuation is define as

$$\varphi(v_i) = v_i - \frac{1 - F_i(v_i)}{f_i(v_i)}.$$

▶ For example, if  $F_i$  is the uniform distribution on [0,1].

Joseph C.-C. Lin CSE, NTOU, TW 16 / 42

## Virtual Valuations

#### Virtual Valuation

For an agent i with valuation distribution  $F_i$  and valuation  $v_i$  (drawn from  $F_i$ ), her virtual valuation is define as

$$\varphi(v_i) = v_i - \frac{1 - F_i(v_i)}{f_i(v_i)}.$$

- ▶ For example, if  $F_i$  is the uniform distribution on [0,1].
  - ►  $F_i(z) = z$  for  $z \in [0, 1]$ .
  - $ightharpoonup f_i(z) = 1.$
  - $\varphi_i(z) = z \frac{1-z}{1} = 2z 1$  on [0, 1].
- It is always at most the corresponding valuation.
- lt could be negative.

Joseph C.-C. Lin CSE, NTOU, TW 16 / 42

## What do virtual valuations mean?

$$\varphi(v_i) = v_i - \frac{1 - F_i(v_i)}{f_i(v_i)}.$$

- ► One possible interpretation:
  - v<sub>i</sub>: what you'd like to charge
  - $ightharpoonup rac{1-F_i(v_i)}{f_i(v_i)}$ : inevitable revenue loss caused by not knowing  $v_i$  in advance.

Joseph C.-C. Lin CSE, NTOU, TW 17 / 42

## What do virtual valuations mean?

$$\varphi(v_i) = v_i - \frac{1 - F_i(v_i)}{f_i(v_i)}.$$

- ► One possible interpretation:
  - v<sub>i</sub>: what you'd like to charge
  - $ightharpoonup rac{1-F_i(v_i)}{f_i(v_i)}$ : inevitable revenue loss caused by not knowing  $v_i$  in advance.
- Second interpretation:
  - $\triangleright \varphi(v_i)$ : the slope of a revenue curve at  $v_i$ .

# The Crucial Lemma (the proof is postponed)

#### Lemma (5.1 in the Textbook)

For every single-parameter environment with valuation distributions  $F_1, \ldots, F_n$ , every DSIC mechanism  $(\mathbf{x}, \mathbf{p})$ , every agent i, and every value  $\mathbf{v}_{-i}$  of the valuations of the other agents,

$$\mathsf{E}_{\mathsf{v}_i \sim \mathsf{F}_i}[\mathsf{p}_i(\mathsf{v})] = \mathsf{E}_{\mathsf{v}_i \sim \mathsf{F}_i}[\varphi_i(\mathsf{v}_i) \cdot \mathsf{x}_i(\mathsf{v})].$$

Note: the identity holds in expectation over  $v_i$ , and not pointwise.

4 D > 4 D > 4 E > 4 E > E 9 Q Q

Joseph C.-C. Lin CSE, NTOU, TW 19 / 42

# The Crucial Lemma (the proof is postponed)

#### Lemma (5.1 in the Textbook)

For every single-parameter environment with valuation distributions  $F_1, \ldots, F_n$ , every DSIC mechanism (x, p), every agent i, and every value  $\mathbf{v}_{-i}$  of the valuations of the other agents,

$$\mathbf{E}_{v_i \sim F_i}[p_i(\mathbf{v})] = \mathbf{E}_{v_i \sim F_i}[\varphi_i(v_i) \cdot x_i(\mathbf{v})].$$

- Note: the identity holds in expectation over  $v_i$ , and not pointwise.
  - $\triangleright \varphi_i(v_i)$  could be negative for some i.

Joseph C.-C. Lin CSE, NTOU, TW 19 / 42

#### The Main Theorem

## Theorem (5.2 in the Textbook)

For every single-parameter environment with valuation distributions  $F_1, \ldots, F_n$  and every DSIC mechanism  $(\mathbf{x}, \mathbf{p})$ ,

$$\mathbf{E}_{\mathbf{v} \sim \mathbf{F}} \left[ \sum_{i=1}^n p_i(\mathbf{v}) \right] = \mathbf{E}_{\mathbf{v} \sim \mathbf{F}} \left[ \sum_{i=1}^n \varphi_i(\mathbf{v}_i) \cdot \mathbf{x}_i(\mathbf{v}) \right].$$

▶ That is, the expected **revenue** equals the expected **virtual welfare**!.

Luck C C Liv

Joseph C.-C. Lin CSE, NTOU, TW 20 / 42

#### Proof of Theorem 5.2

► Taking the expectation, with respect to  $\mathbf{v}_{-i} \sim \mathbf{F}_{-i}$ , of both sides of the equation in Lemma 5.1: (i.e.,  $\mathbf{E}_{v_i \sim F_i}[p_i(\mathbf{v})] = \mathbf{E}_{v_i \sim F_i}[\varphi_i(v_i) \cdot x_i(\mathbf{v})])^1$ 

$$\mathbf{E}_{\mathbf{v}\sim\mathbf{F}}[p_i(\mathbf{v})] = \mathbf{E}_{\mathbf{v}\sim\mathbf{F}}[\varphi_i(v_i)\cdot x_i(\mathbf{v})].$$

Joseph C.-C. Lin CSE, NTOU, TW 21 / 42

<sup>&</sup>lt;sup>1</sup>Consider  $v_i \sim F_i$  and for any  $\mathbf{v}_{-i}$  of the other agents.

#### Proof of Theorem 5.2

▶ Taking the expectation, with respect to  $\mathbf{v}_{-i} \sim \mathbf{F}_{-i}$ , of both sides of the equation in Lemma 5.1: (i.e.,  $\mathbf{E}_{v_i \sim F_i}[p_i(\mathbf{v})] = \mathbf{E}_{v_i \sim F_i}[\varphi_i(v_i) \cdot x_i(\mathbf{v})]^1$ 

$$\mathbf{E}_{\mathbf{v}\sim\mathbf{F}}[p_i(\mathbf{v})] = \mathbf{E}_{\mathbf{v}\sim\mathbf{F}}[\varphi_i(v_i)\cdot x_i(\mathbf{v})].$$

► Applying the linearity of expectation twice:

$$\mathbf{E}_{\mathbf{v} \sim \mathbf{F}} \left[ \sum_{i=1}^{n} p_{i}(\mathbf{v}) \right] = \sum_{i=1}^{n} \mathbf{E}_{\mathbf{v} \sim \mathbf{F}} [p_{i}(\mathbf{v})]$$

$$= \sum_{i=1}^{n} \mathbf{E}_{\mathbf{v} \sim \mathbf{F}} [\varphi_{i}(v_{i}) \cdot x_{i}(\mathbf{v})]$$

$$= \mathbf{E}_{\mathbf{v} \sim \mathbf{F}} \left[ \sum_{i=1}^{n} \varphi_{i}(v_{i}) \cdot x_{i}(v_{i}) \right].$$

4 D > 4 B > 4 E > 4 E > 9 Q P Joseph C.-C. Lin CSE, NTOU, TW 21 / 42

# Maximization concerning only the allocation rule

Theorem 5.2 says that: even though we only care about "payments", we can still focus on an optimization problem concerning only the allocation rule of the mechanism.

Joseph C.-C. Lin CSE, NTOU, TW 23 / 42

# Maximization concerning only the allocation rule

- ► Theorem 5.2 says that: even though we only care about "payments", we can still focus on an optimization problem concerning only the allocation rule of the mechanism.
- ▶ So, how should we choose the allocation rule **x** to maximize

$$\mathsf{E}_{\boldsymbol{v}\sim\boldsymbol{F}}\left[\sum_{i=1}^n\varphi_i(v_i)\cdot \mathsf{x}_i(v_i)\right]?$$

- ► An obvious approach: maximize pointwise:
  - For each  $\mathbf{v}$ , choose  $\mathbf{x}(\mathbf{v})$  to maximize the virtual welfare obtained on input  $\mathbf{v}$ , subject to feasibility of the allocation.

<ロ > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 。 < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回

## Regularity Comes to the Rescue

#### Regular Distribution

A distribution F is **regular** if the corresponding virtual valuation function  $v - \frac{1 - F(v)}{f(v)}$  is non-decreasing.

Joseph C.-C. Lin CSE, NTOU, TW 27 / 42

## Regularity Comes to the Rescue

### Regular Distribution

A distribution F is **regular** if the corresponding virtual valuation function  $v - \frac{1 - F(v)}{f(v)}$  is non-decreasing.

- ▶ For example, consider *F* to be the uniform distribution on [0,1].
- lt's regular since the corresponding  $\varphi(v) = 2v 1$  which is nondecreasing in v.

Joseph C.-C. Lin CSE, NTOU, TW 27 / 42

### Virtual Welfare Maximizer

Assume that  $F_i$  is regular for each i.

- 1. Transform the (truthfully reported) valuation  $v_i$  of agent i into  $\varphi_i(v_i)$ .
- 2. Choose the feasible allocation  $(x_1, \ldots, x_n)$  that maximizes the virtual welfare  $\sum_{i=1}^n \varphi_i(v_i)x_i$ .
- 3. Charge payments according to Myerson's payment formula (refer to previous lectures).

Joseph C.-C. Lin CSE, NTOU, TW 28 / 42

# Virtual Welfare Maximizers Are Optimal

#### Theorem 5.4

For every single-parameter environment and regular distributions  $F_1, \ldots, F_n$ , the corresponding virtual welfare maximizer is a DSIC mechanism with the maximum-possible expected revenue.

Joseph C.-C. Lin CSE, NTOU, TW 29 / 42

# Virtual Welfare Maximizers Are Optimal

#### Theorem 5.4

For every single-parameter environment and regular distributions  $F_1, \ldots, F_n$ , the corresponding virtual welfare maximizer is a DSIC mechanism with the maximum-possible expected revenue.

- Here revenue-maximizing mechanisms are almost the same as welfare-maximizing ones.
- ▶ They differ only in using *virtual* valuations in place of valuations.

Joseph C.-C. Lin CSE, NTOU, TW 29 / 42

Joseph C.-C. Lin CSE. NTOU. TW 31 / 42

### Theorem (Myerson's Lemma)

Fix a single-parameter environment.

- An allocation rule x is implementable if and only if it is monotone.
- (ii) If x is monotone, then there is a unique payment rule for which the direct-revelation mechanism  $(\mathbf{x}, \mathbf{p})$  is DSIC and  $p_i(\mathbf{b}) = 0$  whenever  $b_i = 0$ .
- The payment rule in (ii) is given by an explicit formula.

### Proof of the Main Lemma (5.1)

#### The Crucial Lemma

#### Lemma 5.1

For every single-parameter environment with valuation distributions  $F_1, \ldots, F_n$ , every DSIC mechanism  $(\mathbf{x}, \mathbf{p})$ , every agent i, and every value  $\mathbf{v}_{-i}$  of the valuations of the other agents,

$$\mathbf{E}_{v_i \sim F_i}[p_i(\mathbf{v})] = \mathbf{E}_{v_i \sim F_i}[\varphi_i(v_i) \cdot x_i(\mathbf{v})].$$

Note: the identity holds in expectation over  $v_i$ , and not pointwise.

Joseph C.-C. Lin CSE, NTOU, TW 34 / 42

- Assume that we have
  - ightharpoonup a DSIC mechanism (x, p);
  - ▶ the allocation rule: *x*
  - the valuation profile: **v**.
- ► Recall Myerson's payment formula:

$$p_i(v_i, \mathbf{v}_{-i}) = \int_0^{v_i} z \cdot x_i'(z, \mathbf{v}_{-i}) dz.$$

for the payment made by agent i.

Assume that  $x_i(z, \mathbf{v}_{-i})$  is differentiable.

- Assume that we have
  - ightharpoonup a DSIC mechanism (x, p);
  - the allocation rule: x
- ▶ the valuation profile: **v**.
- ► Recall Myerson's payment formula:

$$p_i(v_i, \mathbf{v}_{-i}) = \int_0^{v_i} z \cdot x_i'(z, \mathbf{v}_{-i}) dz.$$

for the payment made by agent i.

- Assume that  $x_i(z, \mathbf{v}_{-i})$  is differentiable.
  - The same formula holds more generally, including piecewise constant functions, for a suitable interpretation of  $x'_i(z, \mathbf{v}_{-i})$  and the corresponding integral.

Fix an agent i. We have

$$\mathbf{E}_{v_i \sim F_i}[p_i(\mathbf{v})] = \int_0^{v_{\text{max}}} p_i(\mathbf{v}) f_i(v_i) dv_i$$

$$= \int_0^{v_{\text{max}}} \left[ \int_0^{v_i} z \cdot x_i'(z_i, \mathbf{v}_{-i}) dz \right] f_i(v_i) dv_i$$

▶ 1st equality exploits the independence of agents' valuations.

We now consider the expected value and variance for continuous random variables. Note that the interpretation of each is the same as in the discrete setting, but we now have a different method of calculating them in the continuous setting.

+ Table of contents

#### Definition 4.2.1

If X is a continuous random variable with pdf f(x), then the **expected value** (or **mean**) of X is given by

$$\mu = \mu_X = \mathrm{E}[X] = \int\limits_{-\infty}^{\infty} x \cdot f(x) \, dx.$$

▶ Reversing the order of integration in

$$\int_0^{v_{\text{max}}} \left[ \int_0^{v_i} z \cdot x_i'(z_i, \mathbf{v}_{-i}) dz \right] f_i(v_i) dv_i$$

yields

$$\int_{0}^{v_{\text{max}}} \left[ \int_{z}^{v_{\text{max}}} f_{i}(v_{i}) dv_{i} \right] z \cdot x'_{i}(z, \mathbf{v}_{-i}) dz$$

$$= \int_{0}^{v_{\text{max}}} (1 - F_{i}(z)) \cdot z \cdot x'_{i}(z, \mathbf{v}_{-i}) dz.$$

Using integration by parts:

$$\int_0^{v_{\text{max}}} \underbrace{(1-F_i(z))\cdot z}_{g(z)} \cdot \underbrace{x_i'(z, \mathbf{v}_{-i})}_{h'(z)} dz.$$

Joseph C.-C. Lin CSE, NTOU, TW 40 / 42

Using integration by parts:

$$\int_{0}^{V_{\text{max}}} \underbrace{\left(1 - F_{i}(z)\right) \cdot z}_{g(z)} \cdot \underbrace{x_{i}'(z, \mathbf{v}_{-i})}_{h'(z)} dz.$$

$$= (1 - F_{i}(z)) \cdot z \cdot x_{i}(z, \mathbf{v}_{-i}) \parallel_{0}^{V_{\text{max}}}$$

$$- \int_{0}^{V_{\text{max}}} x_{i}(z, \mathbf{v}_{-i}) \cdot (1 - F_{i}(z) - zf_{i}(z)) dz$$

Joseph C.-C. Lin CSE, NTOU, TW 40 / 42

Using integration by parts:

$$\int_{0}^{V_{\text{max}}} \underbrace{\left(1 - F_{i}(z)\right) \cdot z}_{g(z)} \cdot \underbrace{x'_{i}(z, \mathbf{v}_{-i})}_{h'(z)} dz.$$

$$= (1 - F_{i}(z)) \cdot z \cdot x_{i}(z, \mathbf{v}_{-i}) \parallel_{0}^{V_{\text{max}}}$$

$$- \int_{0}^{V_{\text{max}}} x_{i}(z, \mathbf{v}_{-i}) \cdot (1 - F_{i}(z) - zf_{i}(z)) dz$$

$$= \int_{0}^{V_{\text{max}}} \underbrace{\left(z - \frac{1 - F_{i}(z)}{f_{i}(z)}\right)}_{\varphi_{i}(z)} x_{i}(z, \mathbf{v}_{-i}) f_{i}(z) dz$$

# Exercise 3 (5%)

- Consider a virtual valuation  $\varphi(v_i) = v_i \frac{1 F_i(v_i)}{f_i(v_i)}$  where F is a strictly increasing distribution function with a strictly positive density function f on the interval  $[0, v_{\text{max}}]$ , with  $v_{\text{max}} < \infty$ .
- For a single bidder with valuation drawn from F, for  $q \in [0,1]$ , define  $V(q) = F^{-1}(1-q)$  as the posted price that yields a probability q of a sale.
- ▶ Define  $R(q) = q \cdot V(q)$  as the expected revenue obtained from a single bidder when the probability of a sale is q.
- ▶ The function R(q), for  $q \in [0,1]$ , is the revenue curve of F. Note that R(0) = R(1) = 0.
- \* Please prove that the slope of the revenue curve at q (i.e., R'(q)) is precisely  $\varphi(v_i)$ .

### Theorem [Derivative of an Inverse Function]

Given an invertible function f(x), the derivative of its inverse function  $f^{-1}(x)$  evaluated at x = a is

$$[f^{-1}]'(a) = \frac{1}{f'[f^{-1}(a)]}.$$

Joseph C.-C. Lin CSE, NTOU, TW 42 / 42

### Theorem [Derivative of an Inverse Function]

Given an invertible function f(x), the derivative of its inverse function  $f^{-1}(x)$  evaluated at x = a is

$$[f^{-1}]'(a) = \frac{1}{f'[f^{-1}(a)]}.$$

▶ Let  $y = f^{-1}(x)$  so x = f(y).

Joseph C.-C. Lin CSE, NTOU, TW 42 / 42

### Theorem [Derivative of an Inverse Function]

Given an invertible function f(x), the derivative of its inverse function  $f^{-1}(x)$  evaluated at x = a is

$$[f^{-1}]'(a) = \frac{1}{f'[f^{-1}(a)]}.$$

- ▶ Let  $y = f^{-1}(x)$  so x = f(y).
- Differentiate both sides w.r.t. x:

$$1 = f'(y) \cdot \frac{dy}{dx}.$$
