# The Arrays as An ADT

- Arrays.
  - a set of pairs <index, value>.
  - for each index, there is a value associated with that index.
  - a consecutive set of memory locations.
  - mathematical terms: correspondence, mapping, etc.

4/18

### Implementation of 1-D Array

- int list[5]
  - Five consecutive memory locations are allocated.
  - The address of list[0]: base address.
- int list[5], \*plist[5];
  - sample code for the second.

variable	memory address
list[0]	base address $= b$
list[1]	$b+1 \times \texttt{sizeof(int)}$
list[2]	$b+2 \times \texttt{sizeof(int)}$
list[3]	$b+3 \times \texttt{sizeof(int)}$
list[4]	$b+4  imes  exttt{sizeof(int)}$

Fall 2024

### Array in C

- Compare int \*list1 and int list2[5] in C.
  - Both list1 and list2 are pointers.
  - list2 reserves five memory locations.
- Some notations:
  - list2:
  - (list2+i):
  - \*(list2+i):

### Array in C

- Compare int \*list1 and int list2[5] in C.
  - Both list1 and list2 are pointers.
  - list2 reserves five memory locations.
- Some notations:
  - list2: a pointer to list2[0]
  - (list2+i): &list2[i]
  - \*(list2+i): list2[i]

Arrays and Structures: Structures & Unions
Structures

#### Structures

• An array is a collection of data of the same type.

```
• int arr[] = { 0, 1, 2, 3, 4 };
```

• A structure is a collection of data items, where each item is identified as to its type and name.

```
struct employee {
    char name[10];
    int age;
    double salary;
};
struct employee person;
```

```
struct employee {
    char name[10];
    int age;
    double salary;
} person;
```

## Usage of a struct Variable

```
struct employee {
   char name[10];
   int age;
   double salary;
} person;

strcpy(person.name, "Peter");
person.age = 10;
person.salary = 80000;
```

```
struct employee {
    string name; // C++
    int age;
    double salary;
} person;

person.name = "Peter";
person.age = 10;
person.salary = 80000;
```

Arrays and Structures: Structures & Unions Structures

### typedef

```
typedef int COUNT;
COUNT num1, num2;
typedef struct employee HUMAN_BEING;

HUMAN_BEING person1, person2;
strcpy(person1.name, "Peter");
person.age = 10;
person.salary = 80000;
```

### A structure within a structure is possible

```
typedef struct {
    int month;
    int day;
    int year;
} date;
typedef struct {
    char name[10];
    int age;
    float salary;
    date birthday;
} HUMAN BEING;
```

#### The usage:

```
HUMAN_BEING person;
person.birthday.month = 10;
person.birthday.day = 31;
person.birthday.year = 1979;
```

- Unions

Arrays and Structures: Structures & Unions Unions

#### Unions

- Similar to structures.
- The fields of a union must share their memory space.
- Only one field of the union is active at any given time.

```
typedef struct {
    int sex;
    union {
        int kid;
        int beard;
    } u;
} SEX_TYPE;
```

# Characteristics of Unions (code)

- The size of the union is the size of the largest member.
- Only one member can contain data at the same time.

```
union union1 {
    int x;
    int y;
} U1;
union union2 {
    int arr[10];
    char y;
} U2;
```

```
int size1 = sizeof(U1);
int size2 = sizeof(U2):
printf("Sizeof U1: %d\n", size1);
printf("Sizeof U2: %d\n", size2);
```

### An Application Example

binary tree (only leaf nodes have data)

```
struct Node {
   bool is_leaf;
   struct Node* left;
   struct Node* right;
   double data;
};
```

Reference: GeeksforGeeks

```
struct Node {
   bool is_leaf;
   union {
      struct {
            struct Node* left;
            struct Node* right;
      } internal;
      double data;
   } info;
};
```

#### Self-Referential Structures

One or more of its components is a pointer pointing to itself.

```
struct Node {
    int data;
    struct Node* link;
};
typedef struct Node list;
```

```
list item0, item1, item2;
item0.data = data0;
item1.data = data1;
item2.data = data2;
item0.link = &item1;
item1.link = &item2;
item2.link = NULL;
```
